Pawtucket, Rhode Island  
Site Remediation File No. SR-26-0934A/ (Formerly RIDEM Case No. 95-022)

Dear Mr. Martella:

On behalf of The Narragansett Electric Company d/b/a National Grid (National Grid), GZA GeoEnvironmental, Inc. (GZA) has prepared the enclosed *Remedial Action Work Plan (RAWP)* for the Former Tidewater Facility located in Pawtucket, Rhode Island (herein referred to as the Site). This RAWP was prepared consistent with the requirements of Rule 9.00 of the Rhode Island Department of Environmental Management (RIDEM) *Rules and Regulations for the Investigation and Remediation of Hazardous Material Releases (Remediation Regulations)* and includes draft Environmental Land Usage Restrictions (ELURs) and a Soil Management Plan (SMP). As described further herein, RIDEM issued a *Remedial Decision Letter (RDL)* dated April 19, 2018 which formally approved the Site investigation, identified the preferred remedial approach for the Site, and authorized submittal of this RAWP.

Consistent with the October 2013 *Public Involvement Plan (PIP)* established for the Site, an updated fact sheet and notice describing the availability of the RAWP will be distributed to abutters and interested parties along with a date, time, and location for a community outreach event to present this RAWP to the public. This RAWP will be revised to address RIDEM comments as well as those received from the public and subsequently re-submitted to RIDEM as a *RAWP Addendum*. National Grid is prepared to proceed with final design, permitting, and implementation of the remedy described in the *RAWP Addendum* following receipt of an *Order of Approval* from RIDEM.

We look forward to continuing to work cooperatively with RIDEM and the community on this Site. Should you have any questions or comments regarding the information presented herein, please do not hesitate to contact the undersigned or Mr. Kenneth Lento (National Grid) at 781-907-3655.

Very truly yours,

GZA GEOENVIRONMENTAL, INC.

## EXECUTIVE SUMMARY

GZA GeoEnvironmental, Inc. (GZA) has prepared this *Remedial Action Work Plan* (RAWP), on behalf of The Narragansett Electric Company d/b/a National Grid (National Grid), for the former Tidewater Facility located in Pawtucket, Rhode Island (herein referred to as the Site). The RAWP summarizes the results of a Limited Design Investigation (LDI) program to supplement the existing available data, provides technical details on the Site remedy, describes Best Management Practices and the air monitoring program to be implemented during construction of the remedy, and outlines a schedule for execution.

The Site was the former location of the Tidewater manufactured gas plant (MGP) and the Pawtucket No. 1 Power Station and consists of approximately 23 acres across five separate lots owned by National Grid and portions of three lots owned by the City of Pawtucket. The Site is located between Taft Street and an extension of Tidewater and Thornton Streets to the west and the Seekonk River to the east and is now largely vacant except for an active natural gas regulating station located in the northwest portion of the Site and an active switching station and electric substation in the central portion of the Site. The Site is secured with a locked perimeter chain-link fence.

On April 19, 2018, the Rhode Island Department of Environmental Management (RIDEM) issued a *Remedial Decision Letter* (RDL) that formally approved the Site Investigation Report (SIR) and the proposed remedial alternative and required submittal of a RAWP, which provides details and a schedule for implementation of the proposed remedy.

The overall objective of the Site remedy is to protect human health and the environment relative to the identified impacts. Specific remedial objectives for Site soil, groundwater, and air based on the nature and extent of the observed impacts and the current and foreseeable future use of the Site are as follows:

- Mitigation of future human exposure to impacted soils at concentrations above the Method 1 Industrial/Commercial Direct Exposure Criteria (I/C-DEC);
- Mitigation of potential tracking and erosion of near surface impacted soils;
- Mitigation of potential migration of observed Non-Aqueous Phase Liquid (NAPL) impacts to the Seekonk River;
- Reduction in the extent, mass, and mobility of NAPLs to the extent practical;
- Limiting further degradation of groundwater quality; and,
- Addressing potential volatilization issues in the event of future construction of buildings at the Site.

The RIDEM approved remedy to meet these remedial objectives is summarized below:

- Excavation and off-Site disposal of apparent source materials from three areas. These source area excavations include an approximately 100 square foot area proximate to a former underground tank (UGTT-1); a wooden raceway area which includes various sized piping and two concrete structures/vaults formerly used to transfer petroleum between portions of the Site; and an approximately 750 square foot area of fill impacted with crystallized naphthalene in the northern portion of the Site.
- Installation of engineered controls (caps and fencing) to mitigate direct contact with impacted soils and prevent tracking and erosion of materials. Approximately 50% of the engineered cap will also be designed

## EXECUTIVE SUMMARY

to be impermeable to mitigate further degradation of groundwater quality. Construction of these engineered caps will require significant regrading of the Site to create a relatively uniform surface sloping down from the western edges of the Site to the river. Approximately 22,500 cubic yards (CY) of soil will be cut from portions of the Site and re-used as fill in low lying portions of the Site to achieve the subgrade elevations of the engineered caps. In addition, approximately 11,500 CY of imported clean soil will also be necessary to fill the low-lying portions of the Site to achieve the subgrade elevation of the engineered cap. Upon achieving subgrade, approximately 45,000 CY of clean fill material will be imported to construct the engineered caps. An engineered cap will not be installed within the heavily wooded and steep slopes along the southwestern and western portions of the Site due to concerns regarding destabilizing the banks and removing mature trees along portions of the Site perimeter. Access to these slopes will be restricted via the installation of additional chain link fencing which will serve as an engineered control.

- Installation of an approximately 1,300-foot long subsurface containment wall along the eastern (downgradient) edge of portions of the Site to mitigate the potential migration of NAPL impacts towards the Seekonk River. A portion of the containment wall will be installed outboard of the existing bulkhead walls within the Seekonk River to also serve as a replacement to the existing deteriorated bulkheads. The containment wall will consist of steel sheet pile walls with sealed interlock joints driven or vibrated into the ground using a crane mounted hammer.
- Routine NAPL gauging and manual recovery activities will be performed at new recovery wells installed on the upgradient side of the containment wall and as well as certain existing wells. NAPL gauging and recovery activities will initially be performed quarterly for the 1<sup>st</sup> year after installation of the containment wall and then bi-annually after the 1<sup>st</sup> year. The results of these NAPL gauging and recovery activities will be documented in annual reports submitted to RIDEM.
- The long term natural attenuation groundwater monitoring program will consist of the collection of groundwater samples from 27 existing monitoring wells on an annual basis. Groundwater samples will be analyzed for volatile organic compounds (VOCs). The results of this groundwater monitoring program will be documented in annual reports submitted to RIDEM.
- Environmental Land Usage Restrictions (ELURs) will be placed on the property records that outline certain use restrictions for the parcels that comprise the Site. The ELURs will include an integral Soil Management Plan (SMP) that establishes the procedures and provisions should future construction/maintenance activities at the Site require the need to disturb soils beneath the engineered caps and within the areas restricted by the engineered control fencing. The SMP serves to supplement, and will be initiated by, the RIDEM notification requirement established by the ELURs for the Site.
- The engineered controls (caps and fencing), the containment wall, and monitoring and recovery well network will be inspected at least annually for evidence of ground surface settlement, erosion, or other damage. Any observed deficiencies will be repaired in an expedited manner. The results of these inspection and repair activities will be documented in annual reports submitted to RIDEM.

The remedy also includes measures associated with an United States Environmental Protection Agency (EPA) approved remedy to address identified polychlorinated biphenyl (PCB) impacted material (soil, traprock, and concrete) within the fenced, active electrical substation. These remedial measures include excavation and off-

## EXECUTIVE SUMMARY

Site disposal of approximately 95 tons of trap rock, soil, and concrete proximate to the active electrical substation with PCB impacts greater than 50 milligrams per kilogram (mg/kg), placement of a deed restriction on the substation area, securing the substation area with fencing (which is already in-place), and installation of signage on the fencing.

The RAWP summarizes the results of a Limited Design Investigation (LDI) program implemented to collect supplemental data to facilitate the design of the Site remedy. The LDI program was performed between September 21, 2017 and December 28, 2017 and included test pits, test borings, and the collection and analysis of surface and subsurface soil samples. The LDI program also included bathymetric and topographic surveys within the Seekonk River and along the adjacent shoreline to facilitate the design of the containment wall and development of a three-dimensional hydrostratigraphic numerical model of the Site to evaluate whether installation of the proposed containment wall would result in unacceptable groundwater mounding conditions that could potentially alter groundwater flow around the containment wall or to other portions of the Site. The results of the modeling indicated the installation of the containment wall creates an approximately 0.5-foot groundwater mound immediately upgradient of the wall. This localized groundwater mound does not cause a significant alteration of groundwater flow directions upgradient of the wall.

During the implementation of the remedy, Best Management Practices (BMPs) will be implemented to mitigate the potential off-Site migration of contaminants and exposure risks to on-Site workers and the public. These BMPs include implementation of dust and nuisance odor control measures; installation of sedimentation and erosion controls along the waterfront and the north and south perimeter of the Site; installation of a turbidity curtain within the river prior to work on the banks of the river and during installation of the containment wall; limiting the size of temporary working stockpiles; covering of temporary working stockpiles during the work days (to the extent practical) and during all non-working hours; management of any saturated excavated materials in a lined material management area; installation of tracking pads/wheel wash stations; and restricting access to the Site using a combination of the existing chain link fencing supplemented with temporary construction fencing as necessary.

During construction of the remedy, a robust air monitoring program will be implemented to protect the surrounding community as well as Site workers from potential exposure to Site impacts. This program will provide continuous (24-hours per day, 7-days a week), real-time measurement of airborne concentrations of certain compounds that will allow rapid identification of conditions in the event elevated emissions are detected and the aggressive application of engineering controls to keep air quality parameters within acceptable limits. The air monitoring program was designed consistent with the Site-specific *Air Quality Monitoring Plan* established for the Tidewater Site and includes both Tier I (Real Time Monitoring) and Tier II (Time-Integrated Monitoring). The Tier I program will involve the use of both portable, hand held instrumentation to continuously monitor active work zones where earth disturbing/stockpiling is occurring and the deployment of state of the art stationary air monitoring stations along the perimeter of the Site. The Tier II sampling program will involve the collection and analysis of ambient air samples to periodically verify the Tier I results and provide a comparison to the RIDEM Acceptable Ambient Level (AALs) and the applicable action levels established in the Tidewater AQMP.

We anticipate that several permits will be required to construct the remedy including a Coastal Resource Management Council (CRMC) Assent and variance, a Rhode Island Pollutant Discharge Elimination System

## EXECUTIVE SUMMARY

(RIPDES) *General Permit for Stormwater Discharges Associated with Construction Activities*, a RIDEM Office of Water Resources *Water Quality Certification*, and a Narragansett Bay Commission Sewer alteration permit.

Consistent with the PIP, a Community Outreach Event will be held to present this RAWP to the public. This meeting will be held between 6 p.m. and 8 p.m. on July 17, 2018 at the Blackstone Academy Charter School located at 334 Pleasant Street, Pawtucket, RI. This RAWP will be revised based on comments received from RIDEM and the public and a RAWP Addendum will be subsequently re-submitted to RIDEM. The tentative milestone schedule for submittal of the RAWP Addendum and implementation of the RIDEM approved remedy is as follows:

- Community Outreach Event to Present RAWP: Within 1 to 2 months after submittal of RAWP to RIDEM
- Submittal of Summary of Community Outreach Event to RIDEM: 20 days after event
- Revise and Submit *RAWP Addendum* to RIDEM: 60 days after receipt of RIDEM and Public Comments
- RIDEM Issues *Order of Approval*: 30 to 60 days after submittal of the revised RAWP
- Remedy Design and Permitting: 10 to 12 months after receipt of *Order of Approval*
- Implementation/Construction of Remedy: Approximately 18 months (Anticipated to start in the fall of 2019)
- Additional Community Outreach Events: Prior to implementation of the remedy, periodically during implementation, and 30 days following completion of the remedy
- Submittal of Remedial Action Closure Report to RIDEM: Within 2 to 3 months of remedy Completion

## EXECUTIVE SUMMARY

A GZA GeoEnvironmental, Inc. (GZA) preparou este *Plano de Trabalho de Ação Remedial* (RAWP), em nome da Narragansett Electric Company d/ b/a National Grid (National Grid), para a antiga localidade de Tidewater situada em Pawtucket, Rhode Island (aqui referido como o Ste). O projeto RAWP resume os resultados de um Programa de Projeto de Investigação Limitada (LDI) para suplementar os dados disponíveis existentes, fornece detalhes técnicos sobre a remediação do site, descreve as melhores práticas de gerenciamento e o programa de monitoramento do ar a ser implementado durante a construção da remediação e descreve um cronograma para execução.

O Site era a antiga localização da Fábrica de Gás da Tidewater (MGP) e da Central de Energia No.1 de Pawtucket que consiste aproximadamente de 23 acres em cinco lotes separados, detidos por National Grid e partes de três lotes detidos pela Cidade de Pawtucket. O site está localizado entre a rua Taft e uma extensão das ruas Tidewater e Thornton a oeste e o rio Seekonk a leste e por grande parte vazio, exceto um posto regulador de gas natural situado na parte noroeste do site e um posto de ligações elétricas em actividade e uma subestação elétrica na parte central do site. O espaço está fechado com uma cerca de arame no perímetro.

No dia 19 de abril de 2018, o Departamento de Gestão Ambiental de Rhode Island (RIDEM) emitiu uma Carta de Decisão Remediativa (RDL) que formalmente aprovou o Relatório de Investigação do Site (SIR) e a proposta alternativa de remediação e apresentação obrigatória do RAWP, qual fornece detalhes e um cronograma para a implementação da remediação proposta.

O objetivo geral da remediação do Site é proteger a saúde humana e o meio ambiente em relação aos impactos identificados. Os objetivos corretivos específicos para os solos do Site, as águas subterrâneas e o ar com base a natureza e a extensão dos impactos observados e o uso atual e previsível futuro do Site, são os seguintes:

- mitigação da futura exposição humana aos solos impactados em concentrações acima do critério do método 1 da exposição direta industrial/comercial (I/C-DEC);
- mitigação do rastreamento e erosão potenciais dos solos impactados;
- mitigação da migração potencial dos impactos líquidos de fase não aquosos (NAPL) observados no Rio Seekonk;
- redução na medida possível, da extensão da massa e mobilidade dos NAPLs;
- limitando ainda mais a degradação da qualidade das águas subterrâneas; e,
- abordando possíveis problemas de volatilização em caso de futura construção de edifícios no site.

O remediação RIDEM aprovada para cumprir estes objectivos correctores é resumido abaixo:

- escavação e eliminação externa de materiais de fonte, aparente em três áreas. Estas escavações de materiais de fonte incluem uma área de aproximadamente 100 pés quadrados, perto do antigo tanque subterrâneo (UGTT-1); uma área de pista de madeira que inclui vários tamanhos de tubulação e duas estruturas/abóbodas concretas, anteriormente usadas para a transferência de petróleo entre porções do site; e uma área de aproximadamente 750 pés quadrados, impactada com naftaleno cristalizado na porção norte do site.

## EXECUTIVE SUMMARY

- A instalação de controlos de engenharia (tampas e cercas) para atenuar o contato direto com os solos impactados e evitar rastreamento e erosão das materiais. Aproximadamente 50% das tampas de engenharia estão também projetadas para ser impermeáveis e atenuar ainda mais a degradação da qualidade das águas subterrâneas. A construção dessas tampas exigirá uma reclassificação significativa do Site para criar uma superfície relativamente uniforme, das bordas oeste do Site ao Rio. Aproximadamente 22.500 jardas cúbicas (CY) de solo serão cortadas de partes do site e reutilizadas para encherem as camadas baixas do Site e alcançarem as elevações aterradas das tampas de engenharia. Além disso, cerca de 11.500 jardas cúbicas (CY) de solo limpo importado será também necessário para encherem as camadas baixas do Site para alcançarem a elevação aterrada da tampa de engenharia. Após ter atingido a sob-base, aproximadamente 45.000 CY de materia limpa será importada para construir as tampas de engenharia. Nenhuma tampa de engenharia será instalada dentro das encostas íngremes e densamente arborizadas ao longo das porções sudoeste e oeste do site, devido as apreensões relativo a desestabilização dos bancos e a remoção de árvores maduros ao longo das partes do perímetro do Site. O acesso às estas pistas será restrita por causa da instalação da cerca adicional que servirá de controle da engenharia.
- Instalação de um muro de contenção de aproximadamente 1.300 pés ao longo do lado leste (degradado) das partes do Site para mitigar a migração potencial dos impactos NAPL em direção ao Rio Seekonk. Uma parte da parede de contenção será instalada fora das paredes anteparas existentes dentro do Rio Seekonk para servir também como substituto dos muros anteparas deteriorados existentes. A parede de contenção consistirá de paredes de estacas-pranchas de aço com rótulas de intertravamento seladas ou vibradas no solo, usando uma grua montada com um martelo.
- Atividades de rotina de medição e recuperação manual do NAPL, serão realizadas em novos poços de recuperação instalados no lado renovado da parede de contenção e também em alguns poços já existentes. As atividades de medição e recuperação do NAPL serão inicialmente realizadas trimestralmente durante o primeiro ano após a instalação da parede de contenção e duas vezes por ano, depois do primeiro ano. Os resultados destas actividades de medição e recuperação do NAPL, serão documentados nos relatórios anuais submetidos ao RIDEM.
- O programa longo prazo de monitoramento de atenuação natural das águas subterrâneas, consistirá na recolha de amostras de águas subterrâneas de 27 poços já existentes numa base anual. As amostras de águas subterrâneas serão analisadas por compostos orgânicos voláteis (COV). Os resultados deste programa de monitoramento das águas subterrâneas serão documentados em relatórios anuais submetidos a RIDEM.
- Restrições de uso da terra ambiental (ELURs) serão colocados nos registros de propriedade que delineiam certas restrições de uso para as parcelas que compõem o Site. Os ELURs incluirão um Plano Integral de Gereciamento do Solo (SMP) que estabelece os procedimentos e as disposições que deveriam exigir as futuras actividades de construção/manutenção do Site, em caso tiver a necessidade de perturbar os solos sob as tampas de engenharia e dentro das áreas restritas pela cerca de controle de engenharia. O SMP serve para complementar e será iniciada pela RIDEM, com exigência de notificação estabelecida pelos ELURs para o Site.
- Os controlos de engenharia (tampas e cerca), a parede de contenção e monitoramento e recuperação da rede dos poços, serão inspeccionadas pelo menos anualmente por evidências de assentamento da superfície de solo, erosão ou outros danos. Quaisquer deficiências observadas serão reparadas de forma expedita. Os

## EXECUTIVE SUMMARY

resultados destas actividades de inspeção e reparação, serão documentados nos relatórios anuais submetidos ao RIDEM.

A remediação inclui também as medidas associadas com uma Agência de Protecção Ambiental dos Estados Unidos (EPA), remediação aprovada para tratar a materia identificada, o polychlorinated biphenyl (PCB) materia impactada (solo, rocha de armadilha e concreto) dentro da cerca, uma subestação elétrica ativa. Estas medidas correctivas incluem, escavação e eliminação, fora do site de aproximadamente 95 toneladas de rocha de armadilha, solo, e concreto perto da subestação elétrica ativa com impactos de PCB superior a 50 miligramas por quilo (mg/kg), emissão de um ato de restrição na área da subestação, proteção a área da subestação com uma cerca (que já existe no Site) e instalação de sinalização sobre a cerca.

O RAWP resume os resultados de um programa LDI (Projeto de Investigação Limitada) implementado para coletar dados suplementares a fim de facilitar a concepção do site de remediação. O programa LDI foi realizado entre o 21 de setembro de 2017 e o 28 de dezembro de 2017 e incluiu testes de poços, sondagens, coleta e análise das amostras do solo, superfície e subsuperfície. O programa LDI também incluiu levantamentos batimétricos e topográficos dentro do Rio Seekonk e ao longo da costa adjacente para facilitar o desenho da parede de contenção e o desenvolvimento de um modelo numérico tridimensional de hidroestratigráficas do Site, para avaliar se a instalação da parede de contenção proposta, resultaria condições de subida inaceitável das águas subterrâneas que potencialmente poderiam alterar o fluxo das águas subterrâneas ao redor da parede de contenção ou de outras partes do Site. Os resultados da modelagem indicaram que a instalação da parede de contenção cria um aumento das águas subterrâneas de aproximadamente 0.5-pé imediatamente após a elevação da parede. Este aumento localizado no lençol freático não causa uma alteração significativa das direções do fluxo da água subterrânea com a reparação da parede.

Durante a execução da remediação, as Melhores Práticas de Gestão (BMPs) serão implementadas para minimizar a possibilidade de migração fora do Site de contaminantes e riscos de exposição no Site para os trabalhadores e o público. Estas BMPs incluem a implementação de medidas de controle de poeira e incômodo de odor; instalação de controles de sedimentação e erosão ao longo da orla marítima e a norte e perímetro sul do Site; instalação de uma camada de turbidez dentro do Rio antes de trabalhar nos bancos do Rio e durante a instalação do muro de contenção; limitando o tamanho dos estoques de trabalho temporário; cobrindo os estoques de trabalho temporário, durante os dias de trabalho (na medida do possível) e fora das horas de trabalho; gestão de todos os materiais escavados saturados numa área revestida de gestão de material; instalação de estações de lavagem das protecções/rodas; e restringindo o acesso ao site usando ambos uma cadeia ligando a cerca existente com uma cerca temporária da construção, conforme necessário.

Durante a construção da remediação, um programa robusto de monitoramento do ar será implementado para proteger a comunidade do entorno, bem como os trabalhadores do Site da exposição potencial aos impactos do Site. Este programa fornecerá medições contínuas (24 horas por dia, 7 dias por semana) em tempo real de concentrações no ar de certos compostos que permitirão a identificação rápida das condições, no caso de emissões elevadas serem detectadas e a aplicação agressiva da engenharia de controles para manter os parâmetros de qualidade do ar dentro dos limites aceitáveis. O programa de monitoramento do ar foi projetado consistente com o plano de monitoramento da qualidade do ar, especificamente desenhado para o Site de Tidewater e inclui tanto o Tier I (Monitoramento Em Tempo Real) e Tier II (Monitoramento Em Tempo Integrado). O programa Tier I envolverá o uso de instrumentação portátil e manual para monitorar continuamente as zonas ativas de trabalho onde ocorre a perturbação/estocagem de terra e a implantação de estações de monitoramento

## EXECUTIVE SUMMARY

do ar de última geração, ao longo do perímetro do Site. O programa Tier II de amostragem envolverá a coleta e análise das amostras do ar ambiente para verificar periodicamente os resultados de Tier I e fornecer uma comparação ao RIDEM -Nível Ambiental Aceitável (AALs) e os níveis de ação aplicáveis estabelecidos no Tidewater AQMP.

Nós antecipamos que várias autorizações serão requeridas para construir a remediação, incluindo aprovações e variações, um Conselho de Gestão dos Recursos Costeiros (CRMC) um Sistema de Eliminação das Descargas Poluentes de Rhode Island (RIPDES), uma licença geral de descarga das águas pluviais associada com as atividades de construção, um RIDEM Escritório dos Recursos Hídricos certificação da qualidade da água e uma alteração da licença da Baía de Narragansett da Comissão dos esgotos.

Consistente com o PIP, um evento de sensibilização da Comunidade será realizado para apresentar este projecto RAWP ao público. Essa reunião será realizada entre 18:00 às 20:00 horas no dia 17 de julho de 2018 na Blackstone Academy Charter School localizada na 334 Pleasant Street, Pawtucket, RI. Este projecto RAWP será revisto com base nos comentários recebidos do RIDEM e o público e será posteriormente re-submetido a RIDEM. O projeto de cronograma para a finalização do RAWP e a implementação da remediação RIDEM, aprovada é como se segue:

- Evento de sensibilização comunitária para apresentar o plano RAWP Dentro de 1 a 2 meses após o envio de projecto RAWP a RIDEM
- Envio do resumo do evento de sensibilização comunitária a RIDEM: 20 dias após o evento
- Rever e reenviar RAWP a RIDEM: 60 dias após o recebimento a RIDEM e resposta dos comentários públicos
- Questões do RIDEM em *ordem de aprovação*: 30 a 60 dias após a apresentação da Revisão do RAWP
- Remediação da planificação e do licenciamento: 10 a 12 meses após o recebimento da *ordem de aprovação*
- Implementação/construção da remediação: Cerca de 18 meses (de antecipação para começar no outono de 2019)
- Eventos adicionais de sensibilização: Antes da implementação da remediação, periodicamente durante a implementação, e 30 dias após a conclusão da remediação
- Submissão do relatório da conclusão das acções correctivas para o RIDEM: Dentro de 3 meses da conclusão da remediação

## EXECUTIVE SUMMARY

GZA GeoEnvironmental, Inc. (GZA) ha elaborado este *Plan de trabajo de saneamiento* (RAWP), en nombre de The Narragansett Electric Company, de nombre comercial National Grid (National Grid), para las antiguas instalaciones de Tidewater ubicadas en Pawtucket, Rhode Island (en adelante, el Sitio). El RAWP resume los resultados de un programa de Investigación de Diseño Limitado (LDI) para complementar los datos disponibles existentes, proporciona detalles técnicos sobre el saneamiento del Sitio, describe las Prácticas de Gestión Recomendadas (BMP, Best Management Practices) y el programa de monitoreo del aire que se implementará durante la construcción del saneamiento y detalla un cronograma de ejecución.

El Sitio era la antigua ubicación de la planta Tidewater Manufactured Gas Plant (MGP) y la Pawtucket No. 1 Power Station y consta de aproximadamente 23 acres en cinco lotes separados que son propiedad de National Grid y partes de tres lotes que son propiedad de la ciudad de Pawtucket. El Sitio está ubicado entre Taft Street y una extensión de las calles Tidewater Street y Thornton Street al oeste y el río Seekonk al este y ahora está vacante en gran parte a excepción de una estación reguladora de gas natural activa ubicada en la zona noroeste del Sitio y una estación de conmutación activa y subestación eléctrica en la zona central del Sitio. El Sitio está protegido con una cerca de alambre perimetral cerrada.

El 19 de abril de 2018, el Departamento de Gestión Ambiental de Rhode Island (RIDEM, Rhode Island Department of Environmental Management) emitió una *Carta de Decisión sobre el Saneamiento (RDL, Remedial Decision Letter)* que formalmente aprobó el Informe de Investigación del Sitio (SIR, Site Investigation Report) y la alternativa de saneamiento propuesta y la presentación necesaria de un RAWP, que proporciona detalles y un cronograma para la implementación del saneamiento propuesto.

El objetivo general del saneamiento del Sitio es proteger la salud humana y el medioambiente en relación con los impactos identificados. Los objetivos de saneamiento específicos para el suelo, el agua subterránea y el aire del Sitio, en función de la naturaleza y el grado de los impactos observados y el uso actual y previsible en el futuro del Sitio, son los siguientes:

- Mitigación de la exposición humana futura a suelos afectados con concentraciones superiores a los Parámetros Comerciales/Industriales de Exposición Directa de Método 1 (I/C-DEC, Industrial/Commercial Direct Exposure Criteria).
- Mitigación del potencial rastreo y erosión de los suelos afectados cerca de la superficie.
- Mitigación de la potencial migración de los impactos de líquidos de fase no acuosa (NAPL) observados en el río Seekonk.
- Reducción en el grado, la masa y la movilidad de los NAPL en la medida de lo posible.
- Limitación de una mayor degradación de la calidad del agua subterránea.
- Abordaje de los posibles problemas de volatilización en caso de una construcción futura de edificios en el Sitio.

## EXECUTIVE SUMMARY

El saneamiento aprobado por el RIDEM para cumplir con estos objetivos de saneamiento se resume a continuación:

- Excavación y desecho fuera de las instalaciones de materiales de origen aparentes de tres áreas. Estas excavaciones en el área de origen incluyen un área de aproximadamente 100 pies cuadrados cercana a un antiguo tanque subterráneo (UGTT-1); un área de conductos eléctricos de madera que incluye tuberías de diversos tamaños y dos estructuras/bóvedas de concreto utilizadas anteriormente para transferir petróleo entre las partes del Sitio; y un área de relleno de aproximadamente 750 pies cuadrados afectada por naftalina cristalizada en la parte norte del Sitio.
- Instalación de controles diseñados (cubiertas y cercas) para mitigar el contacto directo con los suelos afectados y evitar el rastreo y la erosión de los materiales. Aproximadamente el 50 % de la cubierta diseñada también se proyectará para que sea impermeable a fin de mitigar una mayor degradación de la calidad del agua subterránea. La construcción de estas cubiertas diseñadas exigirá una renovación significativa del Sitio para crear una superficie relativamente uniforme que se incline desde los bordes occidentales del Sitio hasta el río. Aproximadamente 22 500 yardas cúbicas (yd<sup>3</sup>) de suelo se cortarán de partes del Sitio y se reutilizarán como relleno en las partes bajas del Sitio a fin de lograr las elevaciones de explanada de las cubiertas diseñadas. Además, aproximadamente 11 500 yd<sup>3</sup> de suelo limpio importado también serán necesarias para llenar las partes bajas del Sitio a fin de lograr la elevación de la explanada de la cubierta diseñada. Al alcanzar la explanada, se importarán aproximadamente 45 000 yd<sup>3</sup> de material de relleno limpio para construir las cubiertas diseñadas. No se instalará una cubierta diseñada en las pendientes boscosas y pronunciadas a lo largo de las partes suroeste y oeste del Sitio debido a las preocupaciones sobre la desestabilización de las orillas y la eliminación de árboles maduros en partes del perímetro del Sitio. El acceso a estas pendientes se restringirá mediante la instalación de cercas de alambre adicionales que servirán como control diseñado.
- Instalación de una barrera de contención subsuperficial de aproximadamente 1300 pies de longitud a lo largo del borde oriental (aguas abajo) de algunas partes del Sitio a fin de mitigar la posible migración de impactos de NAPL hacia el río Seekonk. Una parte de la barrera de contención se instalará en la parte exterior de los mamparos existentes dentro del río Seekonk para que sirva también como reemplazo de los mamparos deteriorados existentes. La barrera de contención estará formada por muros de láminas de acero con juntas de interbloqueo selladas impulsadas o insertadas por vibración en el suelo mediante un martillo montado en una grúa.
- Se realizarán actividades de rutina de medición y recuperación manual de los NAPL en los nuevos pozos de recuperación instalados en el lado de gradiente ascendente de la barrera de contención y también en ciertos pozos existentes. Las actividades de medición y recuperación de los NAPL se realizarán inicialmente de manera trimestral durante el primer año después de la instalación de la barrera de contención y luego dos veces al año después del primer año. Los resultados de estas actividades de medición y recuperación de los NAPL se documentarán en los informes anuales presentados al RIDEM.
- El programa de monitoreo de agua subterránea de atenuación natural a largo plazo consistirá en la recolección de muestras de agua subterránea de 27 pozos de monitoreo existentes sobre una base anual. Las muestras de agua subterránea se analizarán en busca de compuestos orgánicos volátiles (VOC, volatile organic

## EXECUTIVE SUMMARY

compounds). Los resultados de este programa de monitoreo de aguas subterráneas se documentarán en los informes anuales presentados al RIDEM.

- Las Restricciones Ambientales del Uso de la Tierra (ELUR, Environmental Land Usage Restrictions) se colocarán en los registros de la propiedad que describen ciertas restricciones de uso para las parcelas que constituyen el Sitio. Las ELUR incluirán un Plan de Gestión del Suelo (SMP, Soil Management Plan) integral que establece los procedimientos y las disposiciones en caso de que las futuras actividades de construcción/mantenimiento en el Sitio exijan la alteración del suelo debajo de las cubiertas diseñadas y dentro de las áreas restringidas por la cerca de control diseñado. El SMP sirve para complementar, y será iniciado por, el requisito de notificación del RIDEM establecido por las ELUR para el Sitio.
- Los controles diseñados (cubiertas y cercas), la barrera de contención y la red de pozos de monitoreo y recuperación se inspeccionarán al menos una vez al año en busca de evidencia de asentamiento, erosión u otros daños en la superficie del suelo. Cualquier deficiencia observada se reparará de la manera más rápida posible. Los resultados de estas actividades de inspección y reparación se documentarán en informes anuales presentados al RIDEM.

El saneamiento también incluye medidas asociadas con un saneamiento aprobado por la Agencia de Protección Ambiental de los Estados Unidos (EPA, Environmental Protection Agency) para abordar el material afectado de bifenilo policlorado (PCB) identificado (suelo, rocas fragmentarias y concreto) dentro de la subestación eléctrica activa cercada. Estas medidas de saneamiento incluyen la excavación y el desecho fuera de las instalaciones de aproximadamente 95 toneladas de rocas fragmentarias, suelo y concreto cerca de la subestación eléctrica activa con impactos de PCB mayores a 50 miligramos por kilogramo (mg/kg), la colocación de una restricción de escritura en el área de la subestación, la protección del área de la subestación con cercas (que ya está implementado) y la instalación de señalización en la cerca.

El RAWP resume los resultados de un programa de Investigación de Diseño Limitado (LDI) implementado para recopilar datos complementarios a fin de facilitar el diseño del saneamiento del Sitio. El programa de LDI se realizó entre el 21 de septiembre de 2017 y el 28 de diciembre de 2017 e incluyó fosas para pruebas, pruebas de sondeo y la recolección y análisis de muestras de suelo superficial y subsuperficial. El programa de LDI también incluyó estudios topográficos y batimétricos dentro del río Seekonk y a lo largo de la costa adyacente para facilitar el diseño de la barrera de contención y el desarrollo de un modelo numérico hidroestratigráfico tridimensional del Sitio a fin de evaluar si la instalación de la barrera de contención propuesta provocaría condiciones inaceptables de montículos de aguas subterráneas que podrían alterar el flujo de agua subterránea alrededor de la barrera de contención o a otras partes del Sitio. Los resultados del modelado indicaron que la instalación de la barrera de contención crea un montículo de agua subterránea de unos 0,5 pies inmediatamente cuesta arriba de la barrera. Este montículo de agua subterránea localizado no causa una alteración significativa de las direcciones de flujo del agua subterránea cuesta arriba de la barrera.

Durante la implementación del saneamiento, se implementarán las Prácticas de Gestión Recomendadas (BMP) para mitigar la posible migración de contaminantes fuera del Sitio y los riesgos de exposición para los trabajadores del Sitio y el público. Estas BMP incluyen la implementación de medidas de control de polvo y olores desagradables; la instalación de controles de sedimentación y erosión a lo largo de la costa y el perímetro norte y sur del Sitio; la instalación de una cortina de turbidez dentro del río antes de trabajar en las orillas del río y durante la instalación

## EXECUTIVE SUMMARY

de la barrera de contención; la limitación del tamaño de los depósitos temporales de trabajo; la cobertura de los depósitos temporales de trabajo durante los días de trabajo (en la medida de lo posible) y durante el horario no laborable; el manejo de cualquier material excavado saturado en un área de gestión de material revestido; la instalación de placas de goma/estaciones de lavado de ruedas; y la restricción del acceso al Sitio mediante una combinación del cercado de alambre existente complementado con cercas temporales para construcción, según sea necesario.

Durante la construcción del saneamiento, se implementará un sólido programa de monitoreo del aire para proteger a la comunidad circundante y a los trabajadores del Sitio de la posible exposición a los contaminantes del Sitio. Este programa proporcionará mediciones continuas en tiempo real (24 horas al día, 7 días a la semana) de concentraciones en el aire de ciertos compuestos que permitirán una rápida identificación de las condiciones en caso de que se detecten emisiones elevadas y la aplicación agresiva de controles diseñados para mantener los parámetros de calidad del aire dentro de los límites aceptables. El programa de monitoreo del aire se diseñó de acuerdo con el *Plan de Control de la Calidad del Aire* (AQMP, Air Quality Monitoring Plan) específico del Sitio establecido para el Sitio Tidewater e incluye tanto el Nivel I (Monitoreo en Tiempo Real) como el Nivel II (Monitoreo de Tiempo Integrado). El programa de Nivel I implicará el uso de instrumentos manuales y portátiles para controlar continuamente las zonas de trabajo activas donde se está produciendo una perturbación/acumulación de suelo y el despliegue de estaciones fijas de vanguardia para el monitoreo del aire a lo largo del perímetro del Sitio. El programa de muestreo de Nivel II involucrará la recolección y análisis de muestras de aire ambiental para verificar periódicamente los resultados de Nivel I y proporcionar una comparación con el Nivel Ambiental Aceptable (AAL, Acceptable Ambient Level) del RIDEM y los niveles de acción aplicables establecidos en el AQMP de Tidewater.

Anticipamos que se necesitarán varios permisos para construir el saneamiento, incluida una aprobación y varianza del Consejo de Gestión de Recursos Costeros (CRMC, Coastal Resource Management Council), un Permiso General del Sistema de Eliminación de Contaminantes de Rhode Island (RIPDES, Rhode Island Pollutant Discharge Elimination System) para *Descargas de Aguas Pluviales Asociadas con Actividades de Construcción*, un Certificado de Calidad del Agua (WQC, Water Quality Certification) de la *Oficina de Recursos Hídricos (Office of Water Resources) del RIDEM* y un permiso de alteración del alcantarillado de la Comisión de la Bahía de Narragansett (NBC, Narragansett Bay Commission).

De acuerdo con el Plan de Participación Pública (PIP, Public Involvement Plan), se llevará a cabo un Evento de Alcance Comunitario para presentar este RAWP al público. Esta reunión se llevará a cabo entre las 6 p. m. y las 8 p. m., el 17 de julio de 2018, en la Blackstone Academy Charter School ubicada en 334 Pleasant Street, Pawtucket, RI. Este RAWP se revisará en función de los comentarios recibidos por parte del RIDEM y del público, y se volverá a enviar un Anexo de RAWP posteriormente al RIDEM. El cronograma provisional de hitos para la presentación del Anexo de RAWP y la implementación del saneamiento aprobado por el RIDEM es el siguiente:

## EXECUTIVE SUMMARY

- Evento de Alcance Comunitario para presentar el RAWP: Dentro de 1 a 2 meses después de la presentación del RAWP al RIDEM
- Presentación del Resumen del Evento de Alcance Comunitario al RIDEM: 20 días después del evento
- Revisión y envío del *Anexo del RAWP* al RIDEM: 60 días después de la recepción del RIDEM y comentarios públicos
- El RIDEM publica la *Orden de aprobación*: 30 a 60 días después de la presentación del RAWP revisado
- Diseño y permisos para el saneamiento: 10 a 12 meses después de la recepción de la *Orden de aprobación*
- Implementación/construcción del saneamiento: Aproximadamente 18 meses (se anticipa que comenzará en el otoño de 2019)
- Eventos adicionales de alcance comunitario: Antes de la implementación del saneamiento, periódicamente durante la implementación y 30 días después de la finalización del saneamiento
- Presentación del Informe de Cierre del Saneamiento al RIDEM: Dentro de 2 a 3 meses de la finalización del saneamiento

## 1.0 INTRODUCTION

GZA GeoEnvironmental, Inc. (GZA) has prepared this *Remedial Action Work Plan* (RAWP), on behalf of The Narragansett Electric Company d/b/a National Grid (National Grid), for the former Tidewater Facility located at the terminus of Tidewater and Merry Streets in Pawtucket, Rhode Island (herein referred to as the Site). The Site is also defined as Pawtucket Tax Assessors Plat (A.P.) 54B Lot 826, A.P. 65B Lots 662, 645, 647, 649 and portions of Lot 648, and portions of A.P. 67B Lots 11 and 21. These properties are collectively referred to herein as the "Site." A Site Locus Plan is provided as **Drawing 1** and an Aerial Site Plan depicting the Site boundaries is provided as **Drawing 2A**. This RAWP has been prepared consistent with the requirements of Rule 9.00 of the Rhode Island Department of Environmental Management (RIDEM) *Rules and Regulations for the Investigation and Remediation of Hazardous Materials Releases (Remediation Regulations)*, most recently amended in November 2011 and in response to an April 19, 2018 *Remedial Decision Letter* (RDL) issued by RIDEM which formally approved the Site investigation and identified the preferred remedial approach for the Site. This RAWP serves to present the planned remedy for the Site which consists of the following:

- Limited removal of observed source material in the immediate vicinity of a former underground storage tank (UGTT-1), raceway structures, and an area of fill observed to contain crystallized naphthalene;
- Installation of engineered controls in the form of engineered caps designed to: (1) mitigate potential direct exposure to impacted soils, (2) mitigate potential erosion and tracking of impacted surface soils, and (3) mitigate further degradation of groundwater quality. As described herein, chain-link fencing will serve as the engineered control to restrict access to impacted materials on the steep wooded slopes along the southwestern and western boundaries of the Site to avoid clear cutting the existing vegetation and trees and potentially destabilizing the slopes;
- Physical containment of non-aqueous phase liquid (NAPL) impacts via installation of a containment wall along the eastern edge of portions of the Site. Note: as described further herein, portions of this containment wall will also serve to replace certain existing aging bulkheads along the riverfront;
- Focused NAPL recovery from a network of wells;
- Routine natural attenuation groundwater monitoring;
- Implementation of Environmental Land Usage Restrictions (ELURs) that restrict certain activities and uses and ensures the engineered controls and containment wall are not disturbed. In addition, the ELURs will require that potential volatilization issues are addressed for future buildings constructed at the Site due to exceedances of the GB Groundwater Objectives. The ELURs will include a post-remedial construction Soil Management Plan (SMP) which will outline procedures for managing materials should disturbances below the engineered cap be required. As required by the RDL, drafts of the ELURs and the SMP are included in **Appendix B**; and,
- Annual engineered cap and containment wall inspections and maintenance.

As detailed in GZA's July 2011 Remedial Alternative Evaluation (RAE) report, this remedy was selected due to its ability to achieve the remedial objectives in a relatively timely manner with low risks to both on-Site workers and the surrounding community during implementation and the comparatively limited impact to the surrounding community associated with potential migration and tracking of impacted materials during off-Site transport. Implementation risks will be managed

through the use of Best Management Practices (BMPs) and engineered controls such as wetting or mulching work surfaces, covering stockpiles, and use of odor suppressing foams as described herein.

This RAWP also includes remedial measures associated with an United States Environmental Protection Agency (EPA) approved *Self-Implementing Plan* (SIP) to address identified polychlorinated biphenyl (PCB) impacted material (soil, traprock, and concrete) within the fenced, active electrical substation. Because these PCB impacted materials are located proximate to the active substation, implementation of these PCB remedial measures will need to be performed coincident with a planned electric outage.

In addition, this RAWP includes integration of the Site remedy with the planned substation upgrades which include construction of an approximately 1,080 square foot control house building directly east of the existing substation, demolition of the existing Pawtucket No. 1 substation building, and re-routing of below grade conductors. These Pawtucket No. 1 substation upgrades will be designed and constructed in a coordinated manner consistent with the requirements of this RAWP, including the engineered capping requirements and management of materials consistent with the SMP included in **Appendix B**.

During implementation of the remedial measures outlined herein, perimeter air monitoring will be performed consistent with the requirements of the April 2011 *Air Quality Monitoring Plan* (AQMP) previously developed for the Site. These air monitoring activities are outlined in more detail in Section 11.00.

The Tidewater Site is a Public Involvement Plan (PIP) site. In October 2013, National Grid prepared a PIP for this Site consistent with RIDEM requirements. The PIP establishes procedures for National Grid's sharing of information with the public and describes how the public will be able to comment on plans for the investigation and cleanup of the Tidewater Site. A copy of the October 2013 PIP is included as **Appendix J** for reference. Consistent with the PIP, upon submittal of this RAWP to RIDEM, National Grid will prepare and distribute an updated Site Fact Sheet and schedule a community outreach event to review the planned Site remedy described herein and solicit public feedback. We currently anticipate this event will be held during the summer of 2018. National Grid will inform the public of the planned date, time, and place for this community outreach event at least 3 weeks in advance.

This RAWP is organized as follows:

- Section 1.00 contains this introduction;
- Section 2.00 contains a Site description and a brief summary of Site history;
- Sections 3.00 through 19.00 provide the information required by Rules 9.02 through 9.18 of the *Remediation Regulations*; and,
- Section 20.00 contains the Certification per Rule 9.19 of the *Remediation Regulations*.

This RAWP is subject to the Limitations included in **Appendix A**.

## 2.0 BACKGROUND

The following provides a brief Site description and a summary of relevant past Site operations. For further details, please refer to the January 2011 SIDR.

**2.1 SITE LOCATION AND DESCRIPTION**

The Site was the former location of the Tidewater Manufactured Gas Plant (MGP) and the Pawtucket No. 1 Power Station. The Site consists of approximately 23 acres across eight separate lots located between Taft Street and an extension of Tidewater and Thornton Streets to the west and the Seekonk River to the east. The Site is now largely vacant except for an active natural gas regulating station located in the northwest portion of the Site and an active switching station and electric substation in the central portion of the Site. The Site is secured with a locked perimeter chain-link fence. For discussion purposes, the Site has been subdivided into four areas, as described below and shown on **Drawing 2A**:

- North Fill Area (NFA) (northern portions of A.P. 54B Lot 826);
- Former Gas Plant Area (FGPA) (southern portions of A.P. 54B Lot 826 and A.P. 65B Lot 662);
- Former Power Plant Area (FPPA) (A.P. 65B Lot 645); and
- South Fill Area (SFA) (A.P. 65B Lots 647 and 649, portions of Lot 648, and portions of A.P. 67B Lots 11 and 21).

The following table lists the uses of the properties abutting the Site based on a review of the City of Pawtucket tax assessor’s records. As shown on **Drawing 2A**, the eastern Site property boundaries abut the Seekonk River.

ADJOINING PROPERTIES USAGE	
Description	Direction
Residential properties (A.P. 65B Lots 613, 614, 615 and 616); The International Charter School; the Blackstone Academy; George W. Smith and Son, Inc. Construction Company; and the Red Barn Studio Company (A.P. 54B Lot 497).	West and Northwest
Francis J. Varieur School (A.P. 65B Lot 644) and the Max Read Athletic Field (A.P. 65B Lots 646, 650 and 564 and A.P. 67B Lot 21)	South and Southwest
Undeveloped property owned by the City of Pawtucket (A.P. 54B Lot 827)	North

Current Site features that were taken into consideration in developing this RAWP include the following:

- The ground surface within the footprint of former buildings in the FGPA, as well as the area surrounding the active natural gas regulating station and substation consists of processed gravel;
- Paved driveways and parking areas are present on the north and west sides of the Pawtucket No. 1 substation building in the central portion of the Site and the fenced portion of Tidewater Street;
- Portions of the access road located to the south and southeast of the substation were previously capped consistent with a RIDEM approved *Short-Term Response Action Plan (STRAP)* with a 20-mil polyethylene liner overlain by bedding sand and a layer of processed gravel or traprock;
- Four water hydrants are present on-Site (two in the FGPA and two in the FPPA). One of the two hydrants in the FPPA is active. The other three hydrants are abandoned;
- Two transmission towers are present in the southeastern portion of the FPPA. Active overhead electric transmission lines extend from the substation to the towers and subsequently across the Seekonk River;

- A manmade shoreline (consisting of bulkheads and steel structures) exists along the majority of the shoreline adjacent to the FPPA and the southern portions of the FGPA. The remaining portions of the riverfront along the FGPA and NFA consist of stone retaining walls and rip rap embankments. The shoreline along the southern portions of the FPPA and SFA consists of rip rap, brick, clinker, and some vegetation leading down to tidal marsh flats;
- An engineered cap is present on the surface of an approximately 50-foot long section of the riverbank in the FGPA. The cap consists of an approximately 12-inch thick layer of sand mixed with organo-clay underlying two layers of geotextile fabric enclosing a ½-inch thick layer of organo-clay underlying a layer of armor mats which was installed consistent with a RIDEM approved STRAP;
- A Narragansett Bay Commission (NBC) 48-inch diameter sanitary sewer interceptor, a 24-inch diameter reinforced concrete pipe (RCP) City of Pawtucket storm drain, a 24-inch diameter combined storm/sanitary sewer overflow (CSO) (maintained by NBC), and a 48-inch diameter City of Pawtucket storm drain traverse the Site (see **Drawings 2B and 2C**). A portion of the 24-inch CSO pipe directly adjacent and discharging to the river has failed resulting in erosion of the surrounding ground surface. On-Site stormwater runoff is predominantly transported via overland flow. There are also several catch basins in the area of the Pawtucket No. 1 substation, as depicted on **Drawing 2C**;
- Concrete foundations and slabs associated with former Site structures are visible on the ground surface in the eastern portion of the FGPA; and,
- Chain link fencing surrounds the northern, western, and southern edges of the Site. Additional interior chain link fencing is also present around the substation area, the Pawtucket No. 1 substation building, the transmission towers, the natural gas regulator station, and the SFA.

Our current understanding of Site utilities is shown on **Drawings 2B and 2C**. The layout of these utilities should be considered approximate and additional active and/or abandoned underground utility lines and structures are potentially present.

## 2.2 SITE HISTORY

The following sections contain brief summaries of relevant historic uses for each of the four Site areas. Refer to the January 2011 SIDR for more detailed information on former Site uses and ownership history.

### North Fill Area

The NFA was primarily used for coal and lumber storage from the late-1800s through the mid-1900s. The area has been primarily vacant land since that time. Currently, the NFA consists of vacant wooded/vegetated land.

### Former Gas Plant Area

The MGP operated from the 1880s to approximately 1968. From the 1880s until 1954, the MGP generated gas using the coal carbonization and carbureted water gas processes. Coal was used as the principal fuel to produce coal gas in the coal carbonization process, while coke (enriched with fuel oil) was used to produce carbureted water gas. Coal and tars were also commonly used as feedstock in the carbureted water gas process. Coal and coke storage areas were reportedly located on the NFA, FGPA, and the FPPA. These raw materials were barged to the Site and the storage areas were generally positioned along the Seekonk River. In the later years of operation (1954 until the late-1960s), the MGP produced gas for

peak shaving purposes. Residual by-products were generated during certain operational production phases of the MGP processes. In 1968, the MGP facility was decommissioned. Based on available information, it appears that the majority of the above-ground MGP structures and tanks were razed at that time or before. The last of the two remaining gasholders on the Site (Nos. 7 and 8) were decommissioned and removed from the Site in 2010. Presently, there is an active natural gas regulating station present in the southwestern corner of the FGPA.

### **Former Power Plant Area**

In 1890, the Pawtucket Gas Company commenced building the Pawtucket No. 1 Station for power generation purposes. The No. 1 Station operated from the early-1890s until 1975. The station used coal and petroleum-based products for electricity generation. In addition, the plant used residual byproduct tar from the MGP for power generation. Petroleum products were historically stored in three, large above ground storage tanks (ASTs) formerly located in the southern portion of the FPPA. These tanks, with a capacity of 897,750 gallons each, were used to store fuel oil for the former power plant and MGP operational purposes. In addition, a former underground fuel conveyance system consisting of piping and a wooden raceway extended from the former AST area on the FPPA north towards two former, 21,000-gallon underground storage tanks (USTs) and the FGPA portion of the Site. Presently, transmission towers, an electrical substation and the Pawtucket No. 1 substation switching building are present in the FPPA.

### **South Fill Area**

Historical mapping from 1895 shows a large cove present to the south of the No. 1 Station encompassing a large section of the southwest portion of the FPPA and the majority of the SFA. This area appears filled on the historical mapping from 1939. The SFA is presently vacant consisting primarily of vacant wooded/vegetated land.

Between July 18, 2016 and August 26, 2016, a RIDEM approved *Short Term Response Action* (STRA) was performed within the SFA to address a sinkhole or “washout” area adjacent to the river. The STRA included limited removal of brush/vegetation, stabilization, and capping of the washout area with a 40-mil LLDPE liner, installation of two new concrete manholes and approximately 60 linear feet of new concrete stormwater drain line and an engineered outfall to convey stormwater from the City of Pawtucket’s Max Read Field area to the river, backfill of the washout area with clean import fill, and hydroseeding to establish grass cover over the former washout area. This impermeable cap mitigates direct contact with impacted Site materials and infiltration of precipitation into the underlying impacted soils consistent with the engineered caps described in this RAWP.

## **2.3 REGULATORY HISTORY**

Based on the results of multiple rounds of Site investigations, RIDEM concluded that a release of hazardous materials had occurred at the Site and subsequently issued *Letters of Responsibility* (LOR) to Valley Gas Company and Blackstone Valley Electric Company (BVEC) dated September 12, 1995. In response to the LORs, Atlantic Environmental Services, Inc. (Atlantic) (on behalf of Valley Gas Company and BVEC) completed a Site Investigation program and submitted a *Remedial Investigation Report* to RIDEM on December 30, 1996 which concluded that impacts from former manufactured gas plant (MGP) operations were observed throughout the Site at varying concentrations. In August 2006, Valley Gas Company and BVEC were acquired by National Grid. On behalf of National Grid, Vanasse Hangen Brustlin, Inc. (VHB) subsequently completed a Site investigation program to further evaluate the findings of the previous investigations. VHB submitted a *Site Investigation Report* to RIDEM in November 2006 which included an exposure assessment and outlined proposed remedial alternatives to achieve compliance with the applicable regulations. GZA subsequently submitted a November 2009 *Supplemental Site Investigation Workplan* (SSIWP) to RIDEM with the objective to fill certain data gaps identified during a review of the historic Site investigation studies. This supplemental investigation program was performed between December 2009 and November 2010

and the results were summarized in a January 2011 *Site Investigation Data Report* (SIDR). The January 2011 SIDR in combination with a July 2011 RAE report were submitted to RIDEM and collectively these reports served to fulfill the requirements described in Section 7.08 of the *Remediation Regulations* for a *Site Investigation Report* (SIR). RIDEM subsequently issued a *Program Letter* dated May 25, 2017 that indicated the Site investigation was complete and described the proposed remedy.

Consistent with the October 2013 PIP established for the Site and Rule 7.07C of the *Remediation Regulations*, an initial community meeting was held on July 26, 2017 to summarize the results of the Site investigation and to present the planned remediation. A 14-day public comment period followed the initial community meeting. One comment related to the project schedule was received and RIDEM provided a written response to this comment on August 15, 2017.

## 2.4 ENVIRONMENTAL SETTING

Site topography generally slopes toward the Seekonk River, with an approximate maximum elevation of 35 feet NAVD88 (North American Vertical Datum 1988) along the western boundary of the Site to approximate elevation 8 feet (NAVD88) along the river's edge (eastern boundary of the Site). The Site is within Federal Emergency Management Agency (FEMA) Flood Zones VE (Elevation 13, NAVD88) and AE (Elevation 12, NAVD88). The eastern portion of the Site is also located within the 200-foot jurisdictional limit of the Coastal Resources Management Council (CRMC) as shown on **Drawings 2B and 2C**. The surface of the Site consists primarily of vegetation and gravel. Certain areas of pavement, concrete, and compacted gravel surfaces also exist as shown on **Drawings 2B and 2C**.

Based on observations made during various rounds of Site investigations, subsurface stratigraphy generally consists of fill materials underlain by stratified gravel, sands, silt, and clay, underlain by glacial till and bedrock. The fill materials generally consisted of varying percentages of sand, coal, ash, slag, and former building/structure debris. The thickness of these fill materials has been observed to range from approximately 1 to 2 feet in the northwestern portion of the Site to over 20 feet in the southern portion. Foundations and other features associated with former gas and power plant structures, buildings, concrete and brick foundations, tanks, piping, etc. were encountered within the fill. The native materials encountered in the northwestern portion of the Site were consistent with estuarine deposits, while the native materials encountered beneath the fills across the remainder of the Site consisted of glacial outwash and marine deposits. The estuarine, glacial outwash and marine deposits are underlain by glacial till and bedrock.

The elevation of the top of the glacial till is inferred to generally slope downward from west to east across the Site as the estuarine and outwash deposits thicken proximate to the river. Along the river, the top of the glacial till was encountered at approximate elevations -16 feet (NAVD88) in the northern portion of the FGPA to approximate elevation -70 feet (NAVD88) in the SFA. The bedrock surface was encountered at approximate elevation 4 feet (NAVD88) along the northwestern portion of the Site and is also inferred to slope down to the east and southeast towards the river. Along the river, the top of the bedrock surface was encountered at approximate elevations -28 feet (NAVD88) in the NFA to -45 feet (NAVD88) in the northern portion of the FPPA. Bedrock was not encountered above elevation -70 feet (NAVD88) in the southern portion of the Site adjacent to the river. Shallow bedrock, encountered at approximately 5 feet below grade, along with a bedrock outcrop was also observed in the central portion of the FGPA, west and east of a concrete retaining wall. The ground surface elevation drops approximately 10 feet on the east side of this retaining wall. The bedrock high in the central portion of the FGPA extends from the outcrop approximately 400 feet south towards the FPPA.

The Seekonk River is tidally influenced and has been designated by CRMC as Type 4 waters, defined as multipurpose waters and Type 6 waters, industrial waterfronts and commercial navigation channels. It is classified as SB1{a} waters by RIDEM. The SB1 portion of the classification is assigned to saline waters designated for primary and secondary contact recreational activities and wildlife habitat; suitable for aquacultural uses, navigation and industrial cooling; and good aesthetic value.

The designation assumes that primary contact recreational activities may be impacted due to pathogens from approved wastewater discharges, and the “{a}” indicates that it is a “...partial use designation due to impacts from Combined Sewer Overflows (CSOs).” The groundwater underlying the Site is classified by RIDEM as GB indicating a groundwater resource which RIDEM has designated as not suitable for public or private drinking water use. The Site is located approximately 1.4 miles to the nearest GA designated area (drinking water that has been designated as suitable for public or private drinking water use), located east of the Site, near Slater Park, on the east side of the Seekonk River. The Site and surrounding area are serviced by municipal drinking water. There are no public drinking water supplies within a 1-mile radius of the Site. The closest Wellhead Protection Area (WHPA) is approximately 1.2 miles to the north of the Site.

Site groundwater elevations are tidally influenced and have been observed to fluctuate approximately 5 feet between mean low and high water. Observed groundwater elevations have ranged from approximately 9 to 26 feet NAVD88 (near the northwestern portion of the Site) to elevations 3 to -1 feet NAVD88 proximate to the Seekonk River. In general, groundwater is encountered within the fill materials across the FPPA and SFA where the fill thicknesses are more significant and within the underlying native materials in the FGPA and NFA.

### 3.0 LIMITED DESIGN INVESTIGATIONS (RULE 9.05)

Between September 21, 2017 and December 28, 2017, a Limited Design Investigation (LDI) program was performed generally consistent with the RIDEM approved June 2017 *Limited Design Investigation Workplan*. The goal of these LDIs was to collect sufficient supplemental data to facilitate the design of the RIDEM approved remedy. As summarized in **Tables 1A** through **1C**, these explorations included test pits, test borings, and the collection and analysis of surface and subsurface soil samples. Summaries of the soil analytical testing results can be found in **Tables 2A, 2B, 3, 4A, 4B, 5A, 5B, 6A, and 6B**. A summary of the Quality Assurance and Quality Control (QA/QC) environmental testing results can be found in **Tables 7, 8, 9, and 10**.

Prior to performing these investigations, GZA obtained Finding of No Significant Impact (FONSI) Assents from the CRMC due to certain of the LDI exploration locations being within 200-feet of a coastal feature, and as such, subject to their jurisdiction. Separate Assents were obtained for the lots owned by National Grid and the lots owned by the City of Pawtucket. Copies of these Assents are included in **Appendix C**.

#### 3.1 SURFACE SOIL SAMPLING

On September 21, 22, 26, and 27, 2017, October 2, 2017, and December 8, 2017, GZA collected seventy (70) surface soil samples (GZ-SS-501 to GZ-SS-570) from the western and northern portions of the Site and proximate to the transmission towers (5 of the 70 samples). The primary objective of these surface samples was to evaluate surface soil quality along the steep slopes of the western portion of the Site, in the NFA, and proximate to the transmission towers to facilitate evaluation of capping requirements in these areas. Surface sampling locations are depicted on **Drawings 3A** and **3B** and logs for these explorations are included in **Appendix D**. Laboratory data reports are included in **Appendix E**.

Surface soil samples were collected using a stainless-steel hand-auger from depths ranging from ground surface to approximately 1.5 to 2 feet below ground surface (bgs). Each sample was visually evaluated for the presence of environmental impact, classified according to a modified Burmister soil classification system, and screened for the presence of organic vapors using a handheld photoionization detector (PID). Surface soil observations generally indicated the following:

- Recovered soils generally consisted of fill comprised of sands and gravels with varying percentages of brick, slag, asphalt, concrete, glass, metal, and ash fragments;

- Visible blue staining<sup>1</sup> was observed at surface soil sampling locations GZ-SS-532, GZ-SS-538, GZ-SS-540, and GZ-SS-541 (SFA), GZ-SS-529 (FPPA), and GZ-SS-562, GZ-SS-563 and GZ-SS-565 (NFA);
- PID screening results detected the presence of organic vapors in sample GZ-SS-569 (NFA) at a concentration of 0.1 parts per million (ppm). The remainder of the PID screening results did not detect the presence of organic vapors within the recovered soil samples; and,
- Olfactory impacts were not observed in the surface soil samples except for naphthalene like odors observed in the general area of samples GZ-SS-535 and GZ-SS-536 in the SFA.

Each surface soil sample was analyzed for volatile organic compounds (VOCs), polycyclic aromatic hydrocarbons (PAHs), inorganics, total cyanide, and total petroleum hydrocarbons (TPH). The results of the analytical testing are summarized in **Tables 2A** and **2B** and the extent of I/C-DEC and GB Leachability Criteria exceedances are depicted on **Drawings 4A, 4B, 5A, and 5B**. Note: No exceedances of the Upper Concentration Limits (UCLs) were detected in surface soils during the LDI program. The analytical results indicated the following:

- Arsenic and PAHs (primarily benzo[a]pyrene, benzo[b]fluoranthene, dibenzo[a,h]anthracene, indeno [123-cd]pyrene, and benzo[a]anthracene) were consistently detected at concentrations above the Industrial/Commercial Direct Exposure Criteria (I/C-DEC) in surface soils within the NFA, FPPA, and SFA. These compounds were not detected above the I/C-DEC in the 8 samples collected and analyzed during the LDI program from the FGPA;
- Lead was detected in 4 surface soil samples from the FPPA at concentrations above the I/C-DEC;
- TPH was detected in 8 of the 70 samples at concentrations above the I/C-DEC and GB Leachability Criterion of 2,500 milligrams per kilogram (mg/kg). Six of these 8 samples were collected within the SFA;
- The highest total cyanide concentration detected was 587 mg/kg (sample GZ-SS-532 in the SFA) below the I/C-DEC of 10,000 mg/kg. Total cyanide concentrations within samples where visible blue staining was observed ranged from 1.51 mg/kg to 587 mg/kg (sample GZ-SS-532 in the SFA), respectively; and,
- VOCs were detected in 1 sample (GZ-SS-503) in the NFA, 7 samples in the FPPA, and 6 samples in the SFA at concentrations above the laboratory's reporting limit but below the GB Leachability Criteria and the I/C-DEC.

### 3.2 FORMER TRANSFORMER AREA – CONCRETE AND SURFACE SAMPLING

On September 28, 2017, GZA collected eight (8) concrete (GZ-CS-501 to GZ-CS-508) and surface soil samples from six (6) locations (GZ-SS-FT-501 to GZ-SS-FT-506) in a small portion of the FPPA located west of the current substation area that historically contained transformers prior to construction of the existing substation. The objective of these concrete and surface samples was to evaluate PCB concentrations in this Former Transformer Area. Surface sample locations are depicted on **Drawing 3B** and logs for these explorations are included in **Appendix D**.

Concrete samples were collected from observed stained areas from each equipment pad. At each location, approximately 20 grams of concrete was collected from the upper 0.5-inch of concrete utilizing an electric impact hammer drill, a 0.75-

---

<sup>1</sup> Blue stained soils observed at former MGP sites indicate the likely presence of cyanide complexes associated with former gas purifying operations. These complexes are typically inert and relatively immobile in the environment.

inch masonry drill bit and disposable sampling trays. Consistent with the requirements of the *Toxic Substances Control Act* (TSCA) 40 CFR 761.265 (Subpart N), surface soil samples were collected from the upper 3-inches, 9 to 12-inches bgs, and 21 to 24-inches bgs using stainless steel hand augers at each soil sampling location. Surface soil observations generally indicated the following:

- Surface soils generally consisted of fill comprised of sands and gravels with varying percentages of brick and slag;
- PID field screening results did not detect the presence of organic vapors; and,
- No visual or olfactory evidence of environmental impacts were observed within the recovered soil samples.

Each surface soil and concrete sample was analyzed for PCBs via EPA Method 8082A using manual soxhlet extraction per EPA Method 3540. The results of the analytical testing are summarized in **Table 3** and the sample locations are depicted on **Drawing 8**. Laboratory data reports are included in **Appendix E**. The analytical results indicated PCBs were detected in 1 of the 8 concrete samples at a concentration of 0.2 mg/kg and in 4 of the 18 soil samples at a high concentration of 0.3 mg/kg. These detected PCB concentrations were below the I/C-DEC and GB Leachability Criteria of 10 mg/kg.

### 3.3 TEST PIT EXPLORATIONS

Between September 14 and 26, 2017 and December 19 and 28, 2017, Moran Environmental Recovery LLC of Randolph, Massachusetts completed 64 test pits (GZ-TP-501 through GZ-TP-509, GZ-TP-509A, GZ-TP-510 through GZ-TP-512, GZ-TP-516A, GZ-TP-516B, GZ-TP-516C, GZ-TP-517 through GZ-TP-518, GZ-TP-518A, GZ-TP-519, GZ-TP-521 through GZ-TP-535, GZ-TP-535A, GZ-TP-535B, GZ-TP-536 through GZ-TP-560, GZ-SV-1, and GZ-SV-2) throughout the Site with the exception of the SFA. The objective of these test pits was to evaluate soil quality in the NFA and FGPA, locate the former raceway in order to facilitate the future abandonment of the structure, and to evaluate the presence of potential obstructions (e.g., tie rods and foundations) adjacent to the shoreline that might impede the installation of the containment wall. Test pit locations are depicted on **Drawings 3A** and **3B** and logs for these explorations are included in **Appendix D**.

Test pits ranged in depth from approximately 2 to 14 feet bgs and the excavated soils were temporarily stockpiled on polyethylene sheeting directly adjacent to each test pit. Upon documenting subsurface conditions and collecting and field screening subsurface soil samples, each test pit was backfilled with the original excavated material in approximately the same sequence as removed; that is, the last material removed was the first material replaced. Subsurface observations generally indicated the following:

- Consistent with previous explorations at the Site, fill materials were observed to extend to depths of 2 feet bgs to deeper than the base of certain test pits (approximately 14 feet bgs) in the NFA, FGPA and adjacent to the river. Fill materials generally consisted of sands and gravels with varying percentages of brick, slag, coal, concrete, asphalt, plastic, wood, metal, and ash fragments. Outwash deposits were observed below the fill in test pits GZ-TP-501, GZ-TP-502, GZ-TP-503, GZ-TP-511, GZ-TP-512, GZ-TP-534, GZ-TP-536, GZ-TP-537, GZ-TP-544, GZ-TP-551, GZ-TP-558, GZ-TP-559 and GZ-TP-560;
- Organic silt was observed below the fill and outwash deposits in test pit GZ-TP-543;
- Visible impacts ranging from coatings to saturation with a naphthalene like odor was observed between 2 and 3 feet bgs in test pit GZ-TP-529 (FGPA);

- Visible impacts ranging from staining to saturation with petroleum like odors were observed at various depths within test pits GZ-TP-522 and GZ-TP-523 in the FPPA and test pits GZ-TP-527 and GZ-TP-530 in the FGPA ranging from ground surface to 8 feet bgs;
- Blue stained soils were observed in the fill materials in test pits GZ-TP-516B (0-0.5' bgs) and GZ-TP-539 (0-1' and 2-5' bgs). Test pit GZ-TP-516B was performed in the FGPA and test pit GZ-TP-539 was performed in the NFA;
- Hardened tar was observed in the fill materials at test pits GZ-TP-501 and GZ-TP-504 in the NFA and test pit GZ-TP-552 in the FGPA;
- Remnants of the former wooden raceway including cast iron and wood piping and two concrete vaults were observed in test pits GZ-TP-516, GZ-TP-516A, GZ-TP-516B, GZ-TP-516C, GZ-TP-517, GZ-TP-518, GZ-TP-521, GZ-TP-522, GZ-TP-525 and GZ-TP-526. Residual petroleum like liquid was observed within the raceway components in test pits GZ-TP-516A, GZ-TP-516C, and GZ-TP-526;
- A manhole was observed approximately 4 feet bgs in test pit GZ-TP-518A;
- Inactive below grade clay and steel pipes ranging from 4 to 14-inches in diameter were observed in test pits GZ-TP-508, GZ-TP-511, GZ-TP-516B, GZ-TP-516C, GZ-TP-518, GZ-TP-521 and GZ-TP-522;
- Concrete slabs were observed within the fill materials in test pits GZ-TP-508, GZ-TP-518, GZ-TP-518A, GZ-TP-530, GZ-TP-549, GZ-TP-550 and GZ-TP-553; and,
- Potential tie back rods associated with the existing bulkhead wall were observed approximately 5 feet bgs in test pits GZ-TP-509 and GZ-TP-509A and approximately 8 feet bgs in test pit GZ-TP-524.

Surface and subsurface soil samples were collected from test pits GZ-TP-501 through GZ-TP-512 and GZ-TP-524 and analyzed for VOCs, PAHs, inorganics, total cyanide and TPH. Soil samples collected from test pits GZ-TP-532 through GZ-TP-548 were analyzed for total cyanide. The results of the analytical testing are summarized in **Tables 4A, 4B, 5A, and 5B** and the extent of I/C-DEC and GB Leachability Criteria exceedances are depicted on **Drawings 4A, 4B, 5A, 5B, 6A, 6B, 7A, and 7B**. Laboratory data reports are included in **Appendix E**. The analytical results indicated the following:

#### Surface Soils (0-2 ft bgs):

- Exceedances of the I/C-DEC for PAHs (benzo [a] pyrene, benzo [b] fluoranthene, benzo [a] anthracene, dibenzo [a,h] anthracene and/or indeno [1,2,3-cd] pyrene) were detected in surface soils at 3 test pit locations (2 in the NFA and 1 in the FGPA);
- Exceedances of the I/C-DEC for arsenic were detected in surface soils at 4 test pit locations (2 in the NFA and 2 in the FGPA);
- TPH was detected at concentrations above the I/C-DEC and the GB Leachability Criterion in the surface soil at test pit GZ-TP-501 located proximate to the former coke storage area in the NFA;
- Acetone was detected in 2 samples (GZ-TP-503, 0-2' and GZ-TP-508, 0-2') at concentrations below the I/C-DEC. Test pit GZ-TP-503 is located in the NFA and test pit GZ-TP-508 is located in the FGPA. No other VOCs were detected above the laboratory reporting limit;

- The highest total cyanide concentration detected in surface soils was 696 mg/kg from test pit GZ-TP-546 (FGPA) below the I/C-DEC of 10,000 mg/kg; and,
- No UCL exceedances were detected in the surface soil samples analyzed from these test pits.

#### Subsurface Soils (>2 ft bgs):

- Exceedances of the I/C-DEC for arsenic were detected in 2 samples collected between 4 and 5 feet bgs (GZ-TP-506) and 10 and 11 feet bgs (GZ-TP-508) in the FGPA proximate to the former coal storage area and propane gas tanks;
- Exceedances of the I/C-DEC for PAHs (benzo [a] pyrene, benzo [b] fluoranthene, benzo [a] anthracene, and/or dibenzo [a,h] anthracene) were detected in 2 subsurface soil samples in the FGPA collected between 2 to 3 feet bgs (GZ-TP-510) proximate to the former Coal Storage Area and 3 to 4 feet bgs (GZ-TP-512) proximate to former Gas Holder #5;
- VOCs were not detected at concentrations above the laboratory's reporting limits;
- The highest total cyanide concentration detected in subsurface soils was 353 mg/kg from test pit GZ-TP-553 (FGPA) below the I/C-DEC of 10,000 mg/kg; and,
- No UCL exceedances were detected in the subsurface soil samples analyzed from these test pits.

### 3.4 BORING EXPLORATIONS

Between October 9 and November 8, 2017 and December 6 and 12, 2017, Aquifer Drilling and Testing of Mineola, New York performed 23 boring explorations to evaluate the potential presence of subsurface obstructions along the alignment of the proposed containment wall and to collect geotechnical information to facilitate the design of the containment wall. Four of the borings (GZ-SB-514 through GZ-SB-517) were performed proximate to a future control house building to be constructed as part of planned Pawtucket No. 1 substation upgrades to evaluate the quality of fill. Borings GZ-WB-501 through GZ-WB-504 were performed within the Seekonk River using a barge mounted drill rig. Borings GZ-BW-502, GZ-BW-503, GZ-BW-504A, GZ-BW-506 through GZ-BW-509, GZ-BW-511 through GZ-BW-513, GZ-SB-514 and GZ-SB-515 were performed via rotasonic drilling techniques with collection of continuous cores. Borings GZ-BW-501, GZ-BK-501, GZ-BK-502, GZ-BW-505, GZ-BW-510, GZ-SB-516, GZ-SB-517 and GZ-WB-501 through GZ-WB-504 were performed via standard wash and drive drilling techniques with collection of continuous samples. For most of the land based boring explorations, the upper 6 feet was cleared for the presence of utilities utilizing a combination of an air knife and vacuum excavation. Boring locations are depicted on **Drawings 3A** and **3B** and logs for these explorations are included in **Appendix D**. Subsurface conditions along the eastern edge of the Site are also depicted as cross sections on **Drawings 9A** and **9B**. Cross section locations are shown on **Drawings 3A** and **3B**.

Boring explorations ranged in depth from approximately 16 to 82 feet bgs. Upon documenting subsurface conditions, each boring was backfilled with a cement and bentonite grout mix via a tremie pipe. Excess soil generated during the performance of the boring explorations was containerized in 55-gallon drums and disposed off-Site to a licensed receiving facility pre-approved by National Grid by Clean Harbors Environmental Services of Cranston, RI. Subsurface observations generally indicated the following:

- Consistent with previous explorations at the Site, fill materials were observed to extend to depths as deep as 25 feet bgs. Fill materials generally consisted of sands and gravels with varying percentages of brick, slag, coal, concrete,

asphalt, wood, glass, metal, and ash fragments. Outwash deposits were generally observed below the fill in most borings;

- Organic silt was observed below the fill in borings GZ-BK-501, GZ-BW-510 and GZ-BW-511;
- Glacial till was observed in each of the deep borings (except GZ-BW-512) at depths ranging from 31 feet (elevation -25.8', NAVD88) to 76.7 feet (elevation -61.4, NAVD88) bgs. Glacial till was not observed at a depth of 70 feet bgs (elevation -54.3) at boring GZ-BW-512 within the northeastern portion of the SFA. In general, the till is encountered shallower in the northern portion of the Site along the river and has been observed to dip downward towards the southern portion of the Site;
- Pockets and lenses of visible impacts ranging from NAPL sheens to NAPL saturation with naphthalene like odors were observed in borings GZ-BW-501, GZ-BW-502, GZ-BW-503, GZ-BW-504A, GZ-BW-506, GZ-BW-512, GZ-WB-501, and GZ-WB-504. These visible impacts were observed at various depths ranging from ground surface (GZ-BW-502) to 49.5 feet bgs (approximate elevation -43.7, NAVD88) (GZ-BW-502);
- Pockets and lenses of visible impacts ranging from NAPL sheens to NAPL saturation with petroleum like odors were observed in borings GZ-BW-503, GZ-BW-504A, GZ-BW-506, GZ-BW-509, and GZ-BW-512. These visible impacts were observed at various depths ranging from 6 feet to 15 feet bgs;
- Blue stained soils were observed between 2 and 8 feet bgs within borings GZ-SB-514, GZ-SB-516 and GZ-SB-517 proximate to the proposed location of the new control house;
- Wood chips potentially associated with residual purifier wastes were observed in shallow borings GZ-SB-514 and GZ-SB-515 approximately 4 to 10 feet bgs proximate to the proposed control house;
- Observed impacts within borings GZ-BW-505, GZ-BW-507, and GZ-BW-511 were limited to petroleum like odors, purifier waste like odors in borings GZ-BW-508 and GZ-BW-513, and naphthalene like odors in GZ-WB-502 and GZ-WB-503; and,
- No visible or olfactory impacts were noted in boring GZ-SB-515.

Select soil samples from each boring were analyzed for VOCs and naphthalene. In addition, the samples collected from the borings performed proximate to the proposed control house were also analyzed for TPH, metals, PAHs, and total cyanide. The results of the analytical testing are summarized in **Tables 6A and 6B** and the extent of I/C-DEC and GB Leachability Criteria exceedances are depicted on **Drawings 4A, 4B, 5A, 5B, 6A, 6B, 7A, and 7B**. Laboratory data reports are included in **Appendix E**. As indicated in **Table 6A**, VOCs and naphthalene were not detected at concentrations above the I/C-DEC or GB Leachability Criteria in the soil samples analyzed from the borings performed along the shoreline of the Site or within the river. As indicated in **Table 6B**, arsenic and PAHs were detected at concentrations above the I/C-DEC within the samples analyzed from the borings performed proximate to the proposed control house. TPH (1 sample) and beryllium (2 samples) were also detected at concentrations above the I/C-DEC in soil proximate to the proposed control house. The detected TPH concentration also exceeded the GB Leachability Criteria. Detected total cyanide concentrations were below the I/C-DEC or 10,000 mg/kg.

In addition to the analytical testing, select soil samples were submitted for geotechnical laboratory testing to support the design of the containment wall. Four (4) undisturbed sediment samples were collected from the water-based borings GZ-

WB-501 through GZ-WB-503 using Shelby Tubes for analysis for water content, Atterberg limits, grain size and soil strength. Ten (10) soil samples were collected from the land-based borings (GZ-BW-501, GZ-BK-501, GZ-BK-502, GZ-BW-503, GZ-BW-504, GZ-BW-505, GZ-BW-509, GZ-BW-510, GZ-BW-511 and GZ-BW-512) and tested for grain size using a sieve or hydrometer. An additional ten (10) soil samples were collected from the land-based borings (GZ-BW-501, GZ-BW-502, GZ-BK-502, GZ-BW-503, GZ-BW-506, GZ-BW-507, GZ-BW-509, GZ-BW-511, GZ-BW-512, and GZ-BW-513) and analyzed for pH, sulfate, chloride, and resistivity. Geotechnical laboratory testing results are summarized in **Appendix F**.

### 3.5 BATHYMETRIC SURVEY

On October 11 and 12, 2017, GZA performed bathymetric and topographic surveys within the Seekonk River adjacent to the Site and along the adjacent shoreline to facilitate the design of the containment wall along the river. Prior to the start of the surveys, GZA established field control points including horizontal and vertical field bench mark stations and installed a tide board. The tidal bench mark utilized for the survey was the tidal station disk set by the National Ocean Service (NOS) stamped 3433 A 1994, as listed on the benchmark sheets for the Tidal Station No. 8453433, Rumford, Seekonk River, RI.

The bathymetric survey was performed with survey runs performed at approximately 15-foot centers, parallel to the shoreline using a 20-foot Carolina Skiff survey vessel. Spacing intervals met or exceeded the U.S. Army Corp of Engineers (USACE) Hydrographic Surveying – Engineering Manual for survey line spacing intervals for a single transducer system. Bathymetric survey equipment consisted of an echo sounder, Differential Global Positioning System (DGPS) equipment, and the Hypack data acquisition software.

The topographic survey was focused on the shoreline of the Site and was performed using both a Leica Real Time Kinematic (RTK) Differential Global Positioning System (DGPS) and a Topcon GTS235W total station with a Spectrac Precision Nomad data collector. The shoreline survey was focused on delineating the various existing shoreline structures including: granite block walls, rip rap slopes, articulating concrete mattress, timber and steel sheeting, granite block and concrete wall, intake and outfall structures, sinkholes, salt marsh and vegetated shoreline.

The results of the surveys were incorporated into the base map for the Site, **Drawings 2B and 2C**.

### 3.6 GROUNDWATER MODEL

As part of the LDI work, GZA developed a three-dimensional hydrostratigraphic numerical model of the Site to evaluate whether installation of the proposed containment wall would result in unacceptable groundwater mounding conditions that could potentially alter groundwater flow around the containment wall or to other portions of the Site. The model was created using the available Site-specific boring data, Site hydraulic head data, and precipitation data for the Site area, and the results of on-Site hydraulic conductivity testing.

The numeric model was used to simulate the changes to groundwater flow directions and elevations upon installation of the containment wall.

As expected, the installation of the containment wall does not result in significant alterations to groundwater flow patterns and depths. This simulation indicated that the stagnation zone created by the containment wall results in an approximately 0.5-foot groundwater mound immediately upgradient of the wall. As anticipated, this localized groundwater mound does not cause a significant alteration of groundwater flow directions upgradient of the wall.

A detailed summary of the modeling effort is provided in **Appendix G**.

### 3.7 QUALITY ASSURANCE AND CONTROL SAMPLES

QA/QC samples consisting of duplicates and trip blanks were collected and analyzed during the performance of the LDI program. One duplicate soil sample was collected for approximately every 20 soil samples analyzed and 1 trip blank sample was submitted with each cooler shipped to the laboratory that contained a sample to be analyzed for VOCs. The results of this QA/QC testing are summarized in **Tables 7, 8, 9, and 10**.

As indicated in **Table 7**, 11 trip blank samples were submitted to the laboratory and VOCs were not detected within these samples at concentrations above the laboratory's reporting limits. As indicated in **Tables 8, 9, and 10**, 6 blind duplicate soil samples were analyzed during the course of the LDI program. The average relative percent difference<sup>2</sup> (RPD) between the duplicate sample and the corresponding sample results ranged from 0% to approximately 30% and generally indicated a good correlation (<25% RPD) between the results. The highest RPD values (consistently higher than 50%) were associated with the PAH and total cyanide data between sample GZ-SS-565 (0-2') and its duplicate. These results suggest this sample was not homogenized sufficiently prior to collection; however, the results do not affect the usability or the interpretation of the LDI data.

## **4.0 REMEDIAL OBJECTIVES (RULE 9.02)**

The overall remedial objective for the Site is to protect human health and the environment relative to the identified impacts. Consistent with Rule 9.02 of the *Remediation Regulations* and the July 2011 *Remedial Alternative Evaluation Report* (RAE), the following sections outline specific remedial objectives for Site soil, groundwater, and air based on the nature and extent of the observed impacts and our understanding of the current and foreseeable future use of the Site.

### 4.1 SOIL OBJECTIVES

The primary exposure pathway of concern associated with the identified surface and subsurface soil impacts is direct contact. Based on this exposure pathway, the remedial objectives for soils are to: (1) mitigate current and future human exposure to soils impacted with contaminants at concentrations above the Method 1 I/C-DEC, and (2) mitigate tracking and erosion of surface impacted soils. As described further herein, these remedial soil objectives will be achieved via the removal and off-Site disposal of certain source area materials, the installation of engineered controls (caps and fencing), and implementation of an ELUR. The identified PCB impacted materials proximate to the active substation will be addressed via excavation and off-Site disposal of materials with PCB concentrations greater than 50 mg/kg, placement of an EPA low occupancy deed restriction on the substation area, securing the substation area with fencing (which is already in-place), and installation of large mark (ML) signage on the fencing indicating the presence of PCB containing materials.

The most prominent visual observations of impacted soils were generally within areas of the Site where former historical Site operations were heavily concentrated (*i.e.*, eastern portion of the FGPA along the riverfront and the footprint of the former fuel oil tanks in the FPPA). General observations in each portion of the Site are as follows:

---

$$^2 RPD = \frac{(C_1 - C_2) \times 100}{(C_1 + C_2) / 2}$$

where  $C_1$  = analyte concentration of first analysis  
 $C_2$  = analyte concentration of replicate analysis

- NFA: Limited visual and/or olfactory evidence of impacts were noted within the surface and subsurface soils in the NFA with the exception of a localized area of fill impacted with crystallized naphthalene in the northern portion of the NFA; localized NAPL globs with naphthalene like odors at a depth of 14 to 16 feet bgs; isolated pockets of blue stained surface soils in the northwestern portion of the NFA; and, an area of hardened tar with a naphthalene/creosote-like odor in surface soils in the northwestern portion of the NFA proximate to the northern property boundary.
- FGPA: Subsurface explorations indicate the presence of MGP residuals including wood chips and bluish-green colored soils. The most significant impacts were observed within the footprint of the former MGP operations in the southern and southeastern portions of the FGPA including in the vicinity of former UGTT-4. Subsurface foundations of former MGP structures were also observed within the fill in the central, southern, and eastern portions of the FGPA including a wooden raceway equipped with piping and concrete vaults. Explorations completed in the vicinity of these former MGP features exhibited MGP residual impacts, ranging from sheens to solidified tar-like material in the shallow fill materials.
- FPPA: Observed impacts appear to be primarily related to former petroleum storage proximate to former Oil Tanks No. 1 and 2 and the former 20,000-gallon USTs. Fuel oil-like impacts including separate phase product were also noted proximate to a wooden raceway in the eastern portion of the FPPA. Other significant observations noted in the FPPA include blue/green staining in the shallow soil adjacent to the access road south of the substation (which were previously capped under a RIDEM approved STRAP), within the vicinity of former fuel Oil Tanks No. 1, 2 and 3, and along the western property line south of Bowles Court. Evidence of limited amounts of white powder (assumed to be indicative of naphthalene crystals) was observed to be commingled within the fill on the southern and southwestern portion of the FPPA.
- SFA: MGP residual impacts were evident throughout the SFA including visual observations of hardened tar on the face of the former south washout area and in the surface soils adjacent to the northern fence line separating the SFA and FPPA. In addition, observations of blue staining were noted in the northern portion of the SFA.

Results of the analytical testing of surface soils indicate widespread exceedances of the I/C-DEC for arsenic and PAHs (primarily benzo[a]pyrene, benzo[b]fluoranthene and benzo[a]anthracene) through-out the Site. TPH and lead were also consistently detected within surface soils at concentrations above the I/C-DEC and GB Leachability Criteria (TPH only). VOC impacts above the GB Leachability Criteria were limited to the detection of ethylbenzene in one sample (TP-307) in the FGPA and total cyanide was detected in two surface soils (TP-335 and TP-380) within the FPPA at concentrations above the I/C-DEC. Numeric Upper Concentration Limit (UCL) exceedances within surface soils were limited to PAHs in samples TP-5 (proximate to the former water gas house), TP-14 (FGPA), MW-339D (proximate to the former propane gas tanks and former gas holders), and SS-44 in the SFA<sup>3</sup>; TPH in samples from explorations MW-339D (FGPA) and TP-327, TP-335, TP-370, TP-387B, and TP-386B within the FPPA; lead in sample SS-142 (proximate to former Gasholder No. 8) in the FGPA; and total cyanide in samples from TP-335 and TP-380 within the FPPA.

Consistent with Site wide conditions, arsenic and PAHs were consistently detected at concentrations above the I/C-DEC and TPH and lead were sporadically detected at concentrations above the I/C-DEC and GB Leachability Criteria (TPH only) within the surface soils along the steep, heavily vegetated slopes on the western edges of the Site. Detected cyanide concentrations were below the I/C-DEC and no UCL exceedances were detected within the surface soils along the steep slopes on the western edges of the Site.

---

<sup>3</sup> Sample location was within the footprint of the South Washout area and was addressed during the 2016 Short Term Response Action.

Subsurface soils (those located greater than 2 feet below ground surface) are characterized by similar impacts as surface soils (i.e., TPH and PAHs above the I/C-DEC and the GB Leachability Criteria [TPH only]). Numeric UCL exceedances for TPH were more frequent in subsurface soils than surface soils and numeric UCL exceedances for PAHs were similar in frequency in surface and subsurface soils. Arsenic and lead were detected less frequently in subsurface samples at concentrations above the I/C-DEC when compared to surface soil detections. Cyanide was not detected in subsurface soils at concentrations above the I/C-DEC.

In addition, PCBs were detected proximate to the northwestern portion of the active substation during response activities related to a release of mineral oil dielectric fluid (MODF) from a damaged capacitor in May 2007. PCBs were detected in surface and subsurface soils, traprock, and the concrete foundations of certain substation infrastructure at concentrations above 50 mg/kg proximate to the northwest corner of the active substation. As indicated previously, a Self-Implementing Plan (SIP) was previously approved by EPA to address these PCB impacts. The schedule for this work will require coordination with a planned substation outage.

## 4.2 GROUNDWATER OBJECTIVES

### 4.2.1 Non-Aqueous Phase Liquids

The primary exposure pathway of concern associated with the identified NAPL impacts is potential migration of NAPL to the Seekonk River either via groundwater flow or through the permeable fill materials used to backfill below grade utilities. Based on this exposure pathway, the remedial objective for groundwater includes the mitigation of the potential migration of NAPL impacts to the Seekonk River and a reduction of the extent, mass, and mobility of the identified NAPL impacts to the extent practical. As described further herein, this objective will be achieved via the installation of a containment wall; manual NAPL recovery activities; removal and off-Site disposal of certain identified source areas; and removal and/or sealing and capping of inactive pipes and drains observed within the bank of the river.

Light NAPL (LNAPL) and dense NAPL (DNAPL) impacts have been detected within isolated areas in the northern and eastern portions of the FGPA, FPPA and SFA adjacent to and downgradient of former Site structures. The majority of these former structures were proximate to below and above grade tanks, vaults, or holders used for the storage and management of manufactured gas, tar, or petroleum related products.

In 2017, LNAPL was detected in 7 monitoring wells (MW-210, MW-3, MW-312S, MW-313S, MW-326S, MW-335S and M&E MW-5) in the northern and eastern portions of the FGPA and FPPA at thicknesses ranging from trace levels (less than 0.01 feet) to 2.1 feet. The most persistent and significant levels of LNAPL were measured in wells MW-210, MW-312S and M&E MW-5. As indicated on **Drawings 3A** and **3B**, these wells are located proximate to the former wood piping raceway and piping associated with former ASTs and former USTs. Fingerprint analysis of recoverable LNAPL collected from a well on the FGPA indicated a petroleum product in the boiling range of No. 2 fuel oil/diesel.

In 2017, DNAPL was detected in 8 monitoring wells (MW-4, MW-303, MW-339S, MW-339D, MW-341, MW-1, MW-320S and MW-320D) in the northern and eastern portions of the FGPA, FPPA and SFA at thicknesses ranging from trace levels (less than 0.01 feet) to 14.5 feet. The most persistent and significant levels of DNAPL were measured in monitoring wells MW-303, MW-341, and MW-320 S/D. As depicted on **Drawings 3A** and **3B**, MW-303 and MW-341 are located in the FGPA where former MGP operations were concentrated (i.e., gas holders, clarification tanks, filters, boiling tanks) and proximate to the former wooden raceway and associated piping and vaults. Monitoring well MW-341 is located downgradient of the former No. 8 Gas Holder. Monitoring wells MW-320 S/D are located in the northeastern portion of the SFA where coal waste from the gasification process was received.

We also note that isolated pockets of visible sheening have been historically observed within the Seekonk River directly east of certain active and inactive pipes and drains. These areas of observed sheening are located adjacent to an inactive drain pipe in the southeastern corner of the FGPA, proximate to the active NBC outfall east of the FPPA, and east of the active City of Pawtucket storm sewer drain in the SFA. The visible surface water impacts east of the FGPA and in the SFA are also consistent with elevated PAH and TPH concentrations detected within river sediments proximate to these two areas during a July 2008 sediment study performed by Anchor QEA LLC of Beverly, Massachusetts.

#### 4.2.2 Dissolved Phase Groundwater Objectives

Groundwater quality at the Site is generally characterized by a few isolated exceedances of the GB Groundwater Objectives for benzene, ethylbenzene, and naphthalene, primarily in areas of the Site where former MGP features were historically located. Total VOC concentrations detected during a 2017 monitoring event ranged from 0.0013 milligrams per Liter (mg/L) to 16.95 mg/L. Five samples exceeded the GB Groundwater Objective for one or more VOCs. Three samples exceeded the Method 2 GB Groundwater Objective for naphthalene, four samples exceeded the Method 1 GB Groundwater Objective for benzene, and one sample exceeded the Method 1 GB Groundwater Objective for ethylbenzene. The presence of these compounds in groundwater samples is typical for former MGP and power plant sites and consistent with historical sampling results for the Tidewater Site. None of the VOCs detected in groundwater in 2017 exceeded UCLs.

The two potential pathways/routes of exposure for dissolved phase groundwater impacts at this Site are (1) migration towards the Seekonk River and (2) potential volatilization into overlying buildings. The Site however is within a GB Groundwater Resource Area and the nearest GA and WHPA are located approximately 1.4 miles (to the east) and 2.1 miles (to the north) from the Site, respectively. Given the observed groundwater flow patterns on-Site, the regional groundwater flow direction (towards the Seekonk River) and the locations of the nearest public drinking water supplies and WHPA (not located hydraulically downgradient of the Site), it is not expected that impacts from the Site would affect these groundwater drinking water resource areas. Furthermore, groundwater at the Site is not expected to be classified as a potential future source of drinking water, therefore drinking-water related exposures do not appear to pose a significant level of risk at the Site.

Based on the potential exposure pathways and these conditions, the remedial objective for the observed dissolved phase groundwater impacts involves limiting further degradation of groundwater quality via infiltration. This objective will be accomplished via recovery of the observed NAPL to the extent practical; removal of certain identified source materials including former UGTT-1 and the wooden raceway; and installation of an impermeable cap over portions of the Site. These measures combined with natural attenuation mechanisms will serve to improve dissolved phase groundwater quality over time.

As described in Section 8.03 of the *Remediation Regulations*, GB Groundwater Objectives are based on the potential for VOCs to volatilize from the groundwater into indoor air. Currently, the only building located on Site is the Pawtucket No. 1 substation building, which is unoccupied except for routine maintenance activities. As part of pending substation upgrades/improvements, the Pawtucket No. 1 substation building will be demolished and a new smaller control house (approximately 1,080 square feet) will be constructed directly south of the existing building. Consistent with the draft ELUR attached in **Appendix B**, the new control house building will be equipped with a vapor barrier to mitigate potential volatilization exposure risks.

#### 4.3 AIR OBJECTIVES

Impacts to air quality at the Site are limited to potential indoor air quality impacts associated with volatilization of contaminants from groundwater into overlying structures. As described above, the current Site building houses electrical switch gear equipment and will be demolished as part of planned substation upgrade/improvements. As indicated in the draft ELUR attached in **Appendix B**, structures constructed over groundwater containing GB Groundwater Objective exceedances will require engineered controls to address potential volatilization issues.

#### 4.4 REMEDIAL OBJECTIVES SUMMARY

In summary, the identified remedial objectives for the Site are:

- Mitigation of future human exposure to impacted soils at concentrations above the Method 1 I/C-DEC via installation of engineered controls (caps and fencing) and placement of an ELUR on the property records;
- Mitigation of potential tracking and erosion of near surface impacted soils via installation of engineered controls (caps and fencing);
- Mitigation of future exposure to soils impacted with elevated concentrations of PCBs via excavation and off-Site disposal of Site materials (soil, traprock, and concrete) impacted with PCBs greater than 50 mg/kg, placement of an EPA low occupancy deed restriction on the substation area, securing the substation area with fencing (which is already in-place), and installation of ML signage on the fencing;
- Mitigation of potential migration of observed NAPL impacts to the Seekonk River via installation of a subsurface containment wall, monitoring and manual recovery of observed NAPL impacts, and removal of certain identified source areas that potentially serve as continuing sources;
- Reduction in the extent, mass, and mobility of NAPLs to the extent practical to address UCL exceedances via removal and off-Site disposal of certain identified residual source materials;
- Limiting further degradation of groundwater quality via installation of an impermeable engineered cap and removal of certain identified residual source materials coupled with natural attenuation mechanisms; and
- Addressing potential volatilization issues in the event of future construction of buildings at the Site consistent with the draft ELUR in **Appendix B**.

### **5.0 PROPOSED REMEDY (RULE 9.03)**

This section explains how the RIDEM approved remedy meets the remedial objectives listed in Section 4.4.

#### 5.1 MITIGATION OF FUTURE HUMAN EXPOSURE TO IMPACTED SOILS AND TRACKING AND EROSION OF SURFACE IMPACTED SOILS

Surface (less than 2 feet below grade) and deeper soil impacts were detected through-out the Site at concentrations above the Method 1 I/C-DEC. Mitigation of the potential for direct human contact to these impacted materials and potential tracking and erosion of the shallow surface impacts will be accomplished via a combination of capping and fencing. The limits of the various proposed engineered caps, the existing engineered caps, and the proposed fencing along the toe of

the banks in the western portion of the Site are depicted on **Drawing 10**. Engineered caps will be installed across the majority of the Site and an ELUR will be recorded on the property records. The engineered cap installed in the central portion of the Site (approximately 50% of the Site) where the bulk of the former MGP and power plant operations were performed and the petroleum products were formerly stored and managed will also be designed as an impermeable cap to mitigate infiltration of precipitation through impacted soils and further groundwater degradation. Former activities in the northern portion of the Site were generally limited to the storage of coal. Consistent with these former activities, observations of NAPL have not been historically observed in this portion of the Site and groundwater impacts are less significant than those observed in the FGPA and FPPA. Given these observations, the engineered cap in the northern portion of the Site will be designed as a permeable cap. Installation of these engineered caps will require significant regrading of the Site to create a relatively uniform surface sloping down from the western edges of the Site to the river. We currently anticipate that achievement of Site subgrade elevations will require approximately 22,500 cubic yards (CY) of soil to be cut from portions of the Site and re-used as fill in low lying areas of the Site. We also estimate that an additional 11,500 CY of imported clean fill will also be necessary to fill the balance of the low-lying portions of the Site to achieve the subgrade elevations of the engineered caps.

We also note permeable engineered caps, approved by RIDEM, were previously installed in four areas of the Site. These caps include:

- In 2009, an approximately 50-foot long section of the riverbank in the FPGA was capped with an approximately 12-inch thick layer of sand underlying a reactive core mat underlying an armor layer.
- In 2010, portions of the unpaved access road and parking area south and southeast of the active substation were capped as part of a RIDEM approved *Short Term Response Action*.
- In the FGPA, the area proximate to the active natural gas regulating facility was capped during the 2011 regulator station rebuild.
- In 2016, the south washout area in the SFA was capped as part of a RIDEM approved *Short Term Response Action*.

The extent of these previously installed caps is depicted on **Drawing 10**. These caps will remain to the extent practicable and integrated into the overall engineered barrier. The transitions from new cap areas to older cap areas may require some alteration of the older caps that will depend on further design analysis of the remedy. In addition to these four previously installed engineered caps, the footprint of former Gasholder Nos. 7 and 8 in the northwestern portion of the FGPA was capped in late 2010. This previously installed cap will require some regrading to achieve the subgrade elevations for the new engineered caps described in this RAWP.

Access to the relatively steep, heavily vegetated/wooded slopes located along the western and southern perimeter of the Site will be controlled via installation and maintenance of fencing. Installation of surface engineered caps is not feasible in these areas given the steepness and heavily vegetated/wooded nature of these areas. Given the steepness of the slopes, there are concerns that clear cutting the existing vegetation and trees will destabilize these slopes and increase the potential risk of future failure of the slopes during heavy precipitation events. We also note that the existing vegetation and trees also serve as a buffer to screen the residential properties from the active substation area. Access to these areas is currently restricted with chain link fencing on the perimeter of the Site and additional chain link fencing will be installed within the interior limits of the Site to further restrict access to these slopes.

The engineered controls will be supplemented with placement of ELURs on the property records for the various parcels that ensures the engineered caps and fencing are not disturbed and are inspected annually and repaired (as necessary). The ELURs will also include a SMP that establishes the procedures and provisions should future construction/maintenance

activities at the Site require the need to disturb soils beneath the engineered caps. Drafts of the ELURs and SMP are included in **Appendix B**.

## 5.2 MITIGATION OF FUTURE HUMAN EXPOSURE TO ELEVATED PCB CONCENTRATIONS

Elevated PCB impacts were detected in the vicinity of the active substation area during the response to a release of MODF from a damaged capacitor. Mitigation of potential human exposure to these PCB impacted materials will be achieved via the excavation and off-Site disposal of certain materials (soil, traprock, and concrete) impacted with PCBs at concentrations above 50 mg/kg consistent with the EPA approved SIP. Following excavation of the identified impacted material, confirmatory sampling will be performed to confirm that potential residual PCB impacts are below 50 mg/kg. These active remedial measures will be supplemented with placement of an EPA low-occupancy deed restriction on the substation area, limiting access to the impacted area with chain link fencing (which is already in place), and installation of large mark (ML) signage on the fencing.

These PCB impacted materials are located within the vicinity of an active substation. Given the risks associated with working in the vicinity of energized electrical equipment, these remedial measures will be implemented concurrent with a planned outage.

## 5.3 CONTAINMENT OF NAPL AND REDUCTION IN EXTENT, MASS AND MOBILITY OF NAPL

As indicated previously, NAPL has been observed in the eastern portions of the FGPA, FPPA and SFA adjacent to and downgradient of former MGP and petroleum storage/management related structures. Due to the relatively permeable nature of the Site soils and the physical characteristics of LNAPL, there is a potential for the observed LNAPL impacts in the eastern portion of the Site to migrate to the adjacent Seekonk River and evidence of sheen outbreaks ranging from spots to bands have been observed in the Seekonk River adjacent to areas where upland LNAPL impacts have been noted (adjacent to GZ-BW-509 and GZ-TP-527). DNAPL is less mobile in the environment and the observed DNAPL impacts in the eastern portion of the Site are not expected to migrate laterally significant distances from the source areas.

In order to mitigate the potential migration of NAPLs to the river, an approximately 1,300-foot long containment wall will be installed along the eastern edges of the Site, including downgradient of where the NAPL impacts have been observed. Portions of the containment wall will be installed within the Seekonk River to serve as a replacement to the existing bulkheads which are in generally poor condition. The northern portion of the containment wall will extend to approximate elevation -32 feet<sup>4</sup> and the southern portion will extend to approximate elevation -40 feet (approximately 40 to 45 feet bgs). We anticipate the northern portion of the containment wall will extend into underlying glacial till. Given the assumed undulating surface of the till, the sheetpile tip elevation for the northern portion of the containment wall may be adjusted to account for the till surface elevation.

NAPL impacts have not been observed in the vicinity of the transmission towers adjacent to the Seekonk River. Given the lack of NAPL impacts in this area and the risks associated with construction proximate to the towers and active overhead transmission wires, there will be an approximately 230-foot gap within the containment wall. An engineered cap consisting of a layer of riprap will be installed on the shoreline within this gap to mitigate direct contact with impacted Site materials. In addition, and as shown on **Drawing 10**, the containment wall north and south of this gap will be equipped with wingwalls extending towards the west designed to contain NAPL. Recovery wells will also be positioned proximate to these wingwalls (See **Drawing 18**).

---

<sup>4</sup> All elevations are referenced to NAVD88.

The approximate layout of the proposed containment wall is depicted on **Drawing 10**.

During installation of the containment wall, inactive utilities and pipes present within the bank of the river will be capped/sealed to mitigate these features from acting as preferential migration pathways for the observed LNAPL. Similarly, the NBC and City of Providence drain lines will be extended through the containment wall and the penetration sealed to mitigate potential preferential migration pathways.

Containment of the observed NAPL impacts will be supplemented with quarterly NAPL gauging and manual recovery activities for the 1<sup>st</sup> year subsequent to installation. These NAPL recovery operations will be focused on the monitoring wells where NAPL has been observed and a series of new recovery wells (7 new wells) installed immediately upgradient of the containment wall. The frequency of the NAPL gauging and recovery activities will be modified to bi-annually after the 1<sup>st</sup> year. Subsequent modifications to this frequency will be based on observations made and subject to RIDEM approval.

The ELUR placed on property records for the Site will ensure that the containment wall is not disturbed and that it is inspected annually and repaired (as necessary).

#### 5.4 LIMIT FURTHER DEGRADATION OF GROUNDWATER QUALITY

The installation of the impermeable engineered cap and the manual recovery of the observed NAPL impacts as described above will serve to limit further degradation of groundwater quality. These measures will be supplemented with the removal and off-Site disposal of certain identified materials that are likely acting as continuing sources to observed groundwater impacts. These sources include the wooden raceway and associated piping and vaults within the eastern portions of the FGPA and FPPA, the former UGTT-1 within the FGPA, and the area fill impacted with crystallized naphthalene observed within the NFA. We estimate the excavation to remove UGTT-1 and the wooden raceway and associated piping and vaults will cover an approximately 1,500 square foot area to depths ranging from approximately 2 to 6 feet bgs and the excavation to remove the area of fill with crystallized naphthalene will cover an approximately 750 square foot area to an approximate depth of approximately 3 feet bgs. The approximate extent of these excavations is depicted on **Drawing 10**.

#### 5.5 MITIGATE POTENTIAL VOLATILIZATION ISSUES

Certain dissolved phase VOCs were detected within Site groundwater at concentrations in excess of the GB Groundwater Objectives. As described in Section 4.2, the GB Groundwater Objectives are based on the potential for VOCs to volatilize from the groundwater into indoor air. The Pawtucket No. 1 substation is the only building located on Site and it is not occupied; in addition, this building will be demolished as part of pending substation upgrades. A new smaller control house (approximately 1,080 square feet) will be constructed directly south of the Pawtucket No. 1 substation building as part of these substation upgrades. As indicated previously, consistent with the ELUR, this new control house and any other future buildings constructed over areas where there are exceedances of the GB Groundwater Objectives will be equipped with an engineered control to mitigate potential exposure risks to impacted vapors.

We also note that natural attenuation mechanisms combined with recovery of the observed NAPL to the extent practical, removal of the identified source areas, and installation of the impermeable engineered cap will result in improved Site groundwater quality in the long term. Site groundwater quality will be routinely monitored as described in **Section 11.0**.

## 6.0 REMEDIATION OF IMPACTED GROUNDWATER (RULE 9.04)

As described in Section 4.2, the remedial objectives for groundwater are designed to limit further degradation of Site groundwater quality and mitigate potential volatilization risks in the event of the construction of future buildings on the Site.

Limiting further degradation of groundwater will be accomplished via installation of the impermeable cap over approximately 50% of the Site to prevent infiltration of precipitation through impacted materials, recovery of NAPL from certain existing monitoring wells and recovery wells installed immediately upgradient of the containment wall to the extent practical, and removal of certain source materials likely acting as on-going sources including the wooden raceway and associated components, the area of fill impacted with crystallized naphthalene in the NFA, and UGTT-1. These measures combined with natural attenuation mechanism will result in improvement to groundwater quality over time. In order to mitigate potential volatilization risks, the ELUR placed on the Site's property records will require future buildings constructed on the Site over areas where there are exceedances of the GB Groundwater Objectives be equipped with an engineered control. A draft of the ELUR is included in **Appendix B**.

## 7.0 POINTS OF COMPLIANCE (RULE 9.06)

The following remedial objectives for this Site were identified in Section 4.4:

- Mitigation of future human exposure to soils impacted with contaminants at concentrations above the Method 1 I/C-DEC;
- Mitigation of potential tracking and erosion of near surface impacted soils;
- Mitigation of future exposure to soils impacted with elevated concentrations of PCBs;
- Mitigation of potential migration of observed NAPL impacts to the Seekonk River;
- Reduction in the extent, mass, and mobility of NAPLs;
- Limiting further degradation of groundwater quality; and
- Addressing potential volatilization issues in the event of future construction of buildings at the Site.

Based on these remedial objectives, points of compliance to determine whether these remedial objectives are, or are being achieved will include:

- The quality of the imported fill used for construction of the engineered caps will be tested to confirm compliance with the Residential Direct Exposure Criteria (R-DEC) (See Section 11.3 for testing parameters and frequency). In addition, the integrity of the engineered controls (caps and fencing), containment wall, and monitoring and recovery well network will be inspected at least annually as required by the ELUR and repairs (if required) will be made expeditiously to ensure the remedial objectives are achieved;

- Evaluation of routine NAPL gauging data from the existing monitoring and recovery wells to be installed upgradient of the containment wall. This data will be used to confirm that the wall is serving to contain the identified NAPL impacts and the effectiveness of the routine NAPL recovery program;
- The results of routine groundwater monitoring will be used to evaluate the effectiveness of the NAPL recovery activities, the source area excavations/removal, the impermeable cap, and natural attenuation mechanisms in improving overall Site groundwater quality; and,
- Potential volatilization issues will be monitored via an evaluation of groundwater quality trends. In addition, in the event future buildings are constructed on the Site over areas where there are GB Groundwater Objective exceedances, the mechanisms installed to address potential volatilization risks will be monitored for consistency with their respective objectives.

### 8.0 PROPOSED SCHEDULE FOR REMEDIATION (RULE 9.07)

The following is a tentative milestone schedule for the finalization of the RAWP and implementation of the RIDEM approved remedy. This milestone schedule includes the required public outreach events and notice periods as outlined in the November 2012 (Revised October 2013) PIP:

- |  |   |
|--|---|
| • Community Outreach Event to Present RAWP:                  | Within 1 to 2 months after submittal of RAWP to RIDEM   |
| • Submittal of Summary of Community Outreach Event to RIDEM: | 20 days after event   |
| • Revise and Submit <i>RAWP Addendum</i> to RIDEM:           | 60 days after receipt of RIDEM and Public Comments  |
| • RIDEM Issues <i>Order of Approval</i> :                    | 30 to 60 days after submittal of the <i>RAWP Addendum</i>   |
| • Remedy Design and Permitting:                              | 10 to 12 months after receipt of <i>Order of Approval</i>   |
| • Implementation/Construction of Remedy:                     | Approximately 18 months (Anticipated to start in the fall of 2019)  |
| • Additional Community Outreach Events:                      | Prior to implementation of the remedy, periodically during implementation, and 30 days following completion of the remedy |
| • Submittal of Remedial Action Closure Report to RIDEM:      | Within 2 to 3 months of remedy completion   |

We also note the EPA approved PCB remedy within the active substation will be scheduled to be performed concurrent with a planned outage. The schedule for this PCB remedy will be provided in a separate notification to RIDEM and EPA

once it is determined. In addition, the planned upgrades to the Pawtucket No. 1 substation, including demolition of the existing building and construction of the new control house, will be integrated into this overall Site remedy.

### 9.0 CONTRACTORS AND CONSULTANTS (RULE 9.08)

The engineering consultant involved in the implementation of the remedy is identified below. Once the General Contractor(s) are selected they will be identified to RIDEM under separate cover.

Firm	Role	Contact	Address	Phone Number
GZA	Engineering Consultant	David Rusczyk	655 Winding Brook Drive, Suite 402, Glastonbury, CT 06033	860-858-3110
<i>To be determined</i>	General Contractor	---	<i>To be determined</i>	---

### 10.0 SITE PLAN (RULE 9.09)

A Site plan that depicts the final installed remedy is included as **Drawing 18**. This Site plan also depicts the long-term groundwater monitoring and recovery well network.

### 11.0 DESIGN STANDARDS AND TECHNICAL SPECIFICATIONS (RULE 9.10)

The following sections describe each of the proposed elements designed to meet the stated remedial objectives. In addition, this section also outlines certain Best Management Practices (BMPs) that will be implemented during the performance of the remedial work to mitigate the potential off-Site migration of impacted Site materials, describes the necessary permits/approvals to construct the remedy, and outlines the air monitoring program designed to mitigate potential exposure risks to off-Site receptors. Remedial design details are included on **Drawings 10** through **18**. These Drawings and details were prepared under the supervision of Mr. Todd Greene of GZA, a State of Rhode Island licensed Professional Engineer (P.E. License No. 8567).

Abandonment of certain existing monitoring wells (29 wells) will be required to facilitate implementation of the remedy. A listing of the wells to be abandoned is provided in **Table 11** and depicted on **Drawings 3A and 3B**. These wells will be abandoned consistent with *Appendix 1* of the *Rhode Island Water Quality Regulations*. The remaining existing monitoring well network will be protected and reset as necessary during remedial implementation activities. This procedure may require adjusting the heights of some of the well casings to match proposed final Site grades and installation of new curb boxes. Upon completion of the remedy, the heights of the adjusted well casings will be surveyed relative to NAVD88. We anticipate that the routine NAPL gauging and recovery and groundwater monitoring well network will consist of 39 wells as summarized in **Table 12** and depicted on **Drawing 18**.

In addition, to facilitate the construction of the engineered cap and containment wall, certain existing Site features will require demolition and removal. As shown on **Drawing 11**, these features include but are not limited to, the following:

- With the exception of the slopes in the southwestern portion of the Site and the southern end of the Site, the existing vegetation and trees will be cleared and grubbed to implement the remedy. The resulting organic waste will be disposed/recycled off-Site at a facility permitted to accept this material. Tree stumps will be removed and disposed off-Site in accordance with all state, local and federal regulations. Organic waste and stumps will not be re-used as on-Site fill;
- Several concrete walls and foundations associated with former MGP related structures are present in the central and eastern portions of the FGPA. These concrete structures will be removed to a depth of at least one-foot below the final grade as necessary to install the engineered caps and the containment walls. Non-stained concrete debris will be processed on-Site to 3-inch minus and will either be re-used as fill below the engineered cap or disposed off-Site. Stained concrete debris will be disposed off-Site in accordance with all state, local and federal regulations;
- Certain sections of the existing chain link fencing within the limits of the Site exterior fencing will be removed to the extent necessary to implement the remedy. The resulting chain link fencing debris will be disposed/recycled off-Site in accordance with all state, local and federal regulations;
- The chain link fencing and concrete slabs/foundations in the former transformer area in the western portion of the FPPA will be removed to a depth of at least one-foot below the final grade as necessary to install the engineered caps. Non-stained concrete debris will be processed on-Site to 3-inch minus and re-used as fill below the engineered cap. Stained concrete debris will be disposed off-Site in accordance with all state, local and federal regulations. The chain link fencing debris will be disposed/recycled off-Site in accordance with all state, local and federal regulations;
- Any observed inactive drains and/or pipes observed within the riverbank adjacent to the Site will be sealed and/or capped to mitigate potential preferential contaminant migration pathways;
- The bedrock outcrop present in the central portion of the FGPA will be removed as necessary to facilitate installation of the engineered cap. The bedrock will be removed via hydraulic hammering and the resulting debris will be re-used as fill below the engineered cap;
- As shown on **Drawing 11**, three abandoned hydrants (2 located in the FGPA and 1 located in the FPPA) will be removed and the resulting debris will be disposed off-Site in accordance with all state, local and federal regulations; and,
- An inactive manhole observed while excavating GZ-TP-518A east of the existing Pawtucket No. 1 substation will be filled and abandoned in-place.

### 11.1 SOURCE AREA REMOVAL

As described above, three excavations will be performed to address observed potential sources of NAPL and an area of fill impacted with crystallized naphthalene. The first source area excavation is proximate to former UGTT-1 located in center of the FGPA. In June 2010, approximately 2.5 feet of petroleum/fuel-oil-like impacted water was measured within this structure. Laboratory results from a sample of the water indicated the presence of benzene, toluene, ethylbenzene, xylenes [BTEX], naphthalene, TPH and several PAHs. TPH fingerprinting indicated the presence of a weathered petroleum product in the boiling range of Fuel Oil No. 2/diesel. During this source area excavation, the overlying 4-inch thick concrete pad, the tank/structure, and the impacted soils immediately adjacent to this structure will be excavated and disposed off-Site. Prior to excavation, any observed liquids (groundwater and NAPL) will be removed from the tank/structure (if present) and the interior of the tank/structure cleaned to remove any residual sludges. The resulting

liquid and sludge waste will be disposed off-Site. Upon cleaning, the impacted soil immediately adjacent to the tank/structure will be excavated and disposed off-Site. We anticipate that the excavation will extend approximately 4 feet bgs and over an approximately 10-foot by 10-foot area. The resulting impacted soil will be disposed off-Site in accordance with all state, local and federal regulations. Due to the installation of the impermeable cap in the vicinity of this source area excavation, confirmatory soil samples will not be collected from the base and sidewalls of the excavation.

The second source area excavation is associated with the presence of a wooden raceway and associated piping and two concrete structures/vaults used to transfer petroleum from the FPPA to the FGPA. The wooden portion of the raceway is approximately 218-feet long, 18-inches wide, 6-inches deep and was observed at depths ranging from 1 to 2 feet bgs. The raceway cast iron piping is estimated to cover an approximately 840 feet and ranged in size from 6 to 14-inches in diameter at depths ranging from approximately 1 to 2.5 feet bgs. Concrete structures/vaults associated with the raceway were observed at two locations. These structures varied in size, although they were generally 3.5 feet in width. The vertical extent of the concrete structure observed in test pit TP-379 is approximately 6 feet bgs. The vertical extent of the other remaining concrete structure is unknown (>7 feet bgs). Black petroleum-like liquid (No. 4 fuel oil based on fingerprint analysis) has been observed within portions of the raceway and associated components. These raceway components and associated liquids will be removed, collected, and disposed off-Site. Due to the installation of the impermeable cap and containment wall in the vicinity of this source area excavation, confirmatory soil samples will not be collected from the base and sidewalls of these excavations.

The area of fill impacted with crystallized naphthalene is located in the northern portion of the NFA and covers an approximate 25-foot by 30-foot area to an average depth of approximately 3 feet. This excavation will result in the generation of approximately 84 CY of impacted material for off-Site disposal. Due to the installation of the engineered cap in the vicinity of this source area excavation, confirmatory soil samples will not be collected from the base and sidewalls of the excavation.

During the excavation of these source areas, any groundwater (and NAPL) or stormwater collected will be containerized in temporary storage tanks or fractionation tanks prior to off-Site disposal. Samples of the collected water will be collected and analyzed based on the frequency and the parameters required by the selected disposal facility<sup>5</sup>.

The excavated materials will either be loaded directly into polyethylene lined trucks for off-Site disposal or temporarily stockpiled on-Site outside the 200-foot CRMC jurisdictional zone. Temporary stockpiles will be covered with polyethylene sheeting during non-working hours as described below.

Copies of all manifest(s) and Bills of Lading (BOLs) documenting the off-Site disposal of these materials will be included in the *Remedial Action Closure Report*. Upon completion, the excavations will be backfilled to the subgrade of the engineered cap with Site materials generated during re-grading to achieve the subgrade of the engineered cap or clean imported fill (See Section 11.3 for imported fill testing requirements).

## 11.2 POLYCHLORINATED BIPHENYLS

Consistent with the EPA approved SIP, these elevated PCB impacted materials require excavation and off-Site disposal. Based on the available data, approximately 95 tons of PCB-impacted trap rock, soil, and concrete will be removed during these remedial measures. Due to the proximity of the active electrical substation and the presence of subsurface

---

<sup>5</sup> As an alternative, groundwater and/or collected stormwater generated during the course of the work may be treated on-Site and discharged to the Seekonk River under a Rhode Island Pollutant Discharge Elimination System Remediation Permit.

utilities, we anticipate these remedial measures will be implemented concurrent with a planned outage. Note: depending on timing, this work may be performed separate from the overall Site remedy.

We also note that an unknown concrete structure was encountered within the PCB release area at an approximate depth of 3.5 feet bgs. During performance of the remedial excavation, this concrete structure will be exposed to determine whether it is associated with a former structure or an electrical duct. If the structure is no longer in use, a sample will be collected and analyzed for PCBs on an expedited turnaround time. In the event that PCB concentrations are greater than 50 mg/kg, the concrete will be removed and disposed off-Site. If the structure is part of an electrical duct not scheduled for removal or modification during the substation upgrades, a sample will be collected and analyzed for PCBs on an expedited turnaround time. If laboratory analytical results of the concrete indicate PCB concentrations greater than 50 mg/kg, the cables within the ductwork will be pulled and the PCB-impacted section of ductwork will be removed, replaced, and the cables reinstalled.

All excavated material will be temporarily stockpiled on and covered by polyethylene sheeting for subsequent off-Site disposal. Staked haybales will be placed around the stockpile. Any hand tools used during removal activities will be cleaned and decontaminated in accordance with §761.79(c)(2)(ii) and Subpart S, Double Wash/ Rinse Method for Decontaminating Non-Porous Surfaces.

Following excavation, confirmatory samples will be collected from each media at grid intervals of 1.5 meters (approximately 5 feet) and analyzed for PCBs by EPA Method 8082 and a manual soxhlet extraction with results reported on a dry weight basis. Following the removal of the PCB-impacted soil and receipt of the analytical resulting confirming residual PCB impacts are less than 50 mg/kg, the excavation will be backfilled with clean imported fill.

### 11.3 ENGINEERED CONTROLS

As depicted on **Drawing 10**, the engineered controls will consist of engineered caps across the majority of the Site and additional interior fencing to restrict access to wooded areas along the western and southern Site boundaries. The engineered cap will be constructed across the majority of the Site to supplement the existing caps in the SFA, proximate to the substation, and proximate to the natural gas regulating station. The engineered cap will be designed to mitigate direct contact with impacted soils and prevent tracking and erosion of materials. A portion of the new engineered cap (50%) will also be designed as impermeable to mitigate further degradation of groundwater quality. As indicated above, an engineered cap will not be installed within the heavily wooded and steep slopes along the western portions of the FPPA and SFA due to concerns regarding destabilizing the banks. Access to these slopes will be restricted via the installation of additional chain link fencing which will serve as an engineered control. Refer to **Drawing 10** for a layout of this engineered control fencing.

The engineered caps will consist of the following:

- In the existing paved portions of the Site, the engineered cap will consist of a minimum 2-inch layer of top course and a minimum 2-inch layer of binder course installed directly over the existing asphalt surface. These paved areas are limited to the area to the west and north of the Pawtucket Station No. 1 building;
- In the northern portion of the Site, the cap will be designed to be permeable with a minimum 6-inch layer of topsoil underlain by a minimum 6-inch layer of compacted granular fill underlain by a geotextile fabric that acts as a warning barrier. The existing shoreline along the northern portion of the Site currently consists of granite block walls and natural slopes. The installation of the cap in this area will likely include modifications to this portion of the current

shoreline features to ensure cap stability and limit the potential for future cap erosion. These modifications will likely involve removal of the granite blocks and installation of stabilized slopes;

- The impermeable cap will consist of a minimum 6-inch layer of topsoil (northern portion) or 6-inch thick layer of gravel (southern portion) underlain by a minimum 18-inch layer of processed gravel, sand or other clean fill underlain by a liner system which includes a doubled-sided composite drainage net, a 40-mil HDPE liner, and an 8 oz non-woven geotextile;
- A crushed stone permeable cap will be installed to the east of the Pawtucket No. 1 substation building and the substation. This cap will consist of a minimum 6-inch layer of crushed stone underlain by a minimum 6-inch layer of compacted granular fill underlain by a geotextile fabric that acts as a warning barrier;
- Along portions of the riverfront, in the western portion of the NFA, and west of the natural gas regulating station, the engineered cap will be constructed with rip-rap to stabilize the slopes and mitigate potential erosion. In these areas, the engineered cap will consist of a minimum 12-inch layer of RIDOT R-3 rip rap (8-inch minus stone) underlain by a geotextile fabric that acts as a warning barrier; and,
- An access road and staging area will be constructed to the south of the substation to allow crane access to the transmission towers for long term maintenance related activities. This road and staging area will be constructed with a minimum 6" layer of compacted granular fill underlain by a minimum 18-inch layer of processed gravel, sand or clean fill underlain by a liner system which includes a doubled-sided composite drainage net, a 40-mil HDPE liner, and an 8 oz non-woven geotextile underlain by existing soil subgrade.

Construction of these engineered caps will require significant regrading of the Site to create a relatively uniform surface sloping down from the western edges of the Site to the river. We anticipate approximately 22,500 CY of soil will be cut from portions of the Site and re-used as fill in low lying portions of the Site to achieve the subgrade elevations of the engineered caps. We currently estimate that an additional 11,500 CY of imported clean soil will also be necessary to fill the low-lying portions of the Site to achieve the subgrade elevations of the engineered caps. The cut/fill analysis may be revised based on further refinement of the grades to minimize the amount of material to be moved and brought to the Site to achieve subgrade elevations. An additional 45,000 CY of clean imported and non-impacted material (soil, crushed stone, riprap) will be necessary to construct the engineered caps.

Approximately 56,500 CY of clean fill material will be imported to re-grade the Site to achieve subgrade for the engineered cap (11,500 CY) and to construct the engineered caps (45,000 CY). Approximately 2,800 truck-loads (20 CY/truck) of clean fill will be required to construct the engineered cap. BMPs will be installed at all Site exit points to minimize the potential off-Site migration/tracking of Site materials while importing clean fill to the Site.

All clean fill imported to the Site must meet RIDEM's Residential Direct Exposure Criteria or be declared "non-jurisdictional". For the purpose of this project, only clean native soil from a sand and gravel pit may be considered "non-jurisdictional", contingent upon receipt of paperwork from the sand and gravel pit certifying the origin and content prior to the delivery of the material. All imported granular material must be tested in accordance with criteria set forth below and the testing results must be below the R-DEC:

Analyte	EPA Test Method	Minimum Frequency of Testing
Total Petroleum Hydrocarbons	8100M	One sample per 1,000 CY
Volatile Organic Compounds	8260	One sample per 1,000 CY
Semi-Volatile Organic Compounds	8270	One sample per 1,000 CY
Priority Pollutant Metals (13)	6010 & 7471A	One sample per 1,000 CY
Arsenic & Lead	6010	One sample per 500 CY

#### 11.4 CONTAINMENT WALL

An approximately 1,300-foot long containment wall will be installed along the eastern (downgradient) edge of portions of the FGPA, the FPPA and the SFA to mitigate the potential migration of NAPL impacts towards the Seekonk River. Portions of this containment wall will be installed outboard of the existing bulkhead walls within the Seekonk River to also serve as a replacement to the existing deteriorated bulkheads. The approximate layout of this containment wall is depicted on **Drawings 10 and 14 and 18** and anticipated containment wall sectional profiles are depicted on **Drawings 15 through 17**. The containment wall will consist of steel sheet pile walls with sealed interlock joints driven or vibrated into the ground using a crane mounted hammer and extending to elevation -32 (NAVD88) on the northern end and elevation -40 feet (NAVD88) in the central and southern portions of the wall. Note, given the assumed undulating surface of the till, the sheetpile tip elevation for the northern portion of the containment wall may be adjusted to account for the till surface elevation. A NAPL compatible sealant will be applied within the steel interlocks at the time of driving to minimize potential for migration through the containment walls and specific interlock joints of sheet pile pairs will be shop welded to create a uniform sealed joint prior to installation. This steel sheet pile bulkhead will act as a cantilever wall system eliminating the need for upland bracing in the form of tiebacks or a deadman system.

Pre-excavation will be required to remove potential obstructions along the alignment of the upland portions of the containment wall. Depending on the nature of the observed impacts, the soil generated during these pre-excavation activities may be re-used as on-Site fill to achieve the subgrade elevations for the engineered cap and reduce the required volume of import material to the Site.

Demolition and preclearing of existing bulkhead wall structures (e.g. steel sheeting and timber piling) will also be required to install the containment wall within the Seekonk River. These demolition and preclearing activities will likely require the removal of a limited amount of sediment proximate to the existing bulkhead wall structures. The resulting demolition debris and sediment will be disposed off-Site in accordance with state, local and federal laws, and regulations. In areas where the containment wall is installed within the uplands portion of the Site, riprap will be placed outboard of the sheetpile wall and along the bank to provide shoreline erosion protection of the existing slope and structural support. Subsequent to wall installation, the area between the back of the sheet pile wall and existing waterfront structures will be backfilled with imported clean fill.

As indicated previously, there will be a gap in the containment wall proximate to the transmission towers due to the lack of observed NAPL in this area and concerns regarding the installation of long steel sheets proximate to the high voltage wires spanning the Seekonk River. The riverbank in this area will be improved with a minimum 6-inch layer of bedding material wrapped in a geotextile fabric underlying a minimum 12-inch thick layer of riprap to armor the slope and to limit direct contact with impacted soils. The armored slope (approx. 2.5H:1V) will extend approximately 40 feet from the Mean

High Water (MHW) line to the top of the existing slope. In addition, and as shown on **Drawing 10**, the containment wall north and south of this gap will be equipped with wingwalls extending towards the west designed to contain NAPL.

During installation of the containment wall, any identified inactive drain pipes will be capped and sealed to mitigate the pipes as acting as preferential migration pathways for NAPL. The deteriorated NBC CSO pipe will also be extended through the containment wall and the penetration through the wall sealed to mitigate the potential migration of NAPL.

Seven (7) recovery wells will be installed on the upgradient side of the containment wall to supplement the existing groundwater monitoring well network and facilitate the removal of accumulated NAPL (if any). The approximate locations are shown on **Drawing 18**. The actual locations of these wells will be dependent on Site logistical constraints. These wells will be installed to a similar elevation as the containment wall (approximate elevation -32 to -40 feet, NAVD88). Each well will be equipped with a single 4-inch diameter Schedule 40 PVC well screen that extends from the bottom of the well and spans the natural groundwater table.

### 11.5 VOLATILE EMISSIONS EVALUATION

GZA performed an evaluation of potential volatile emissions prior to implementation of the RIDEM approved remedy. The primary elements of the remedy requiring excavation and management of impacted materials that could potentially result in volatile emissions include:

- Re-grading of the Site to achieve the subgrade for the engineered cap;
- Construction of the containment wall; and,
- Performance of the focused source area removals.

The applicability of Regulation No. 9 was evaluated based on potential volatile emissions calculations/modeling performed consistent with published EPA guidance. This emissions modeling was developed for the specific earthwork activities listed above. The results of this evaluation are included in **Appendix H** and indicate that implementation of the RIDEM preferred remedy **does not** have the potential to increase emissions by greater than the minimum quantities specified in Appendix A of RIDEM APC Regulation No. 9, and, therefore, a minor source permit is not required for this activity.

### 11.6 NAPL RECOVERY

As described above, the containment wall will be equipped with seven (7) 4-inch diameter wells installed on the upgradient side of the wall for the collection and manual recovery of NAPL. As indicated in **Table 12**, NAPL gauging will also be performed on the existing monitoring well network (40 wells). The proposed monitoring and recovery well network is shown on **Drawing 18**.

Based on the existing data set, we anticipate manual LNAPL recovery activities will be focused at existing wells MW-210, MW-3, MW-312S, MW-313S, MW-313D, MW-326S, MW-335S, MW-335D, and M&E MW-5 and manual DNAPL recovery will be focused at existing wells MW-4, MW-303, MW-339S/D, MW-341, MW-1, MW-320S and MW-320D. NAPL gauging and recovery activities will initially be performed quarterly for the 1<sup>st</sup> year after installation of the containment wall. The frequency of the NAPL gauging and recovery activities will be modified to bi-annually after the 1<sup>st</sup> year. Subsequent modifications to this frequency will be based on observations made and subject to RIDEM approval.

The results of these NAPL gauging and recovery activities will be documented in annual reports submitted to RIDEM.

### 11.7 NATURAL ATTENUATION GROUNDWATER MONITORING

The identified dissolved phase groundwater impacts will be addressed via excavation and off-Site disposal of certain source areas, recovery/removal of the identified NAPLs to the extent practicable, and installation of an impermeable cap combined with natural attenuation monitoring. Consistent with the current groundwater monitoring program, the long term natural attenuation groundwater monitoring program will consist of the collection of groundwater samples from existing monitoring wells MW-7, MW-310S, MW-310D, and MW-311 in the NFA, wells MW-201, MW-208, MW-312D, MW-326D, MW-333S, and MW-333D in the FGPA, wells M&E MW-2, MW-6, MW-109, MW-314S, MW-314D, MW-316S, MW-316D, and MW-337 in the FPPA, and wells MW-107, MW-318S, MW-334S and MW-334D in the SFA on an annual basis (refer to **Table 12** and **Drawing 18**). Note, groundwater samples will not be collected from wells with measurable amounts of NAPL.

Groundwater sampling will be performed in general accordance with the United States EPA's September 2017 *Low Stress (low flow) Purging and Sampling Procedure*. As part of this sampling methodology, well stabilization will be determined through the measurement of specific water quality parameters (pH, temperature, specific conductance, dissolved oxygen, oxidation reduction potential, and turbidity) during the purging process. Purging will continue until these parameters have stabilized. Groundwater samples will be analyzed for VOCs. In addition, a Matrix Spike/Matrix Spike Duplicate, a blind duplicate, and a VOC trip blank (in each cooler submitted to the laboratory) will be analyzed each sampling round. The results of this natural attenuation groundwater monitoring program will be documented in annual reports submitted to RIDEM.

After five (5) years, the frequency and number of wells sampled will be re-evaluated and this annual program may be modified. No changes will be made without prior RIDEM approval.

### 11.8 ENGINEERED CONTROLS, CONTAINMENT WALL, AND WELL INSPECTIONS AND MAINTENANCE

The engineered controls (caps and fencing), the containment wall, and monitoring and recovery well network will be inspected at least annually by a qualified environmental professional for evidence of ground surface settlement, erosion, or other damage. Any observed deficiencies will be repaired in an expedited manner.

Consistent with the ELUR, the results of these inspection and repair activities will be documented in annual reports prepared by a qualified environmental professional and submitted to RIDEM.

### 11.9 ENVIRONMENTAL LAND USAGE RESTRICTION

The use of ELURs is an integral component of the remedy. The ELURs will include the following restrictions:

- For the northern portion of the Site (AP 54B, Lot 826 and AP 65B, Lot 662), with the exception of Restricted Residential Activity which would allow passive recreational use but prohibit certain uses/activities including occupied residences at grade level, vegetable gardens, licensed daycares, and elementary and secondary schools, no residential use of these two lots shall be permitted. For the balance of the Site (AP 65B, Lots 645, 647, 649, and the southern portions of Lot 648 and the southern portions of AP 67B, Lots 11 and 21), no residential use of these lots shall be permitted;
- Prohibits potable and irrigation use of Site groundwater;
- Prohibits disturbance of soil beneath the engineered caps without permission from RIDEM, except as permitted in the SMP;
- Prohibits human exposure to soil containing hazardous materials and/or petroleum at concentration exceeding RIDEM approved direct exposure criteria;

- Requires appropriate vapor control measures be included on structures constructed over groundwater containing hazardous materials and/or petroleum at concentrations exceeding RIDEM approved GB Groundwater Objectives; and,
- Requires that the engineered controls (caps and fencing), containment wall, and monitoring and recovery well network remain in-place and in good condition.

Draft versions of these proposed ELURs are included in **Appendix B**.

The ELURs include an integral SMP that establishes the procedures and provisions should future construction/maintenance activities at the Site require the need to disturb soils beneath the engineered cap and within the area restricted by the engineered control fencing. The SMP serves to supplement, and will be initiated by, the RIDEM notification requirement established by the ELURs for the Site. The draft ELURs included in **Appendix B** include a SMP for the Site.

#### 11.10 BEST MANAGEMENT PRACTICES

During the implementation of the remedy, the following Best Management Practices (BMPs) will be implemented. These BMPs are specifically designed to mitigate the potential off-Site migration of contaminants and exposure risks to on-Site workers and the public.

##### 11.10.1 Dust Control

Dust control measures will be employed to mitigate potential exposure of on-Site workers to airborne particulate matter and the potential for a release of airborne particulate matter beyond the limits of the Site in accordance with RIDEM *Air Pollution Control Regulation No. 5, Fugitive Dust*. Methods of dust control will consist of sprinkling the ground surface with water, use of calcium chloride, covering of temporary stockpiles, use of tarpaulins on trucks, mulching, or similar methods.

As described below, work zone and perimeter air monitoring for particulate concentrations will be performed during the implementation of the remedial work. This monitoring will include both visible observations as well as measurements of particulate dust using portable field instruments and air monitoring stations. The anticipated locations of the air monitoring stations are depicted on **Drawing 11**. The numeric limits for particulates established for the Site at the work zone and the perimeter of the Site will be 1,000 micrograms per cubic meter ( $\mu\text{g}/\text{m}^3$ ) and 150  $\mu\text{g}/\text{m}^3$ , respectively. In addition to these numeric limits, the generation of visible dust will not be permitted during the work.

##### 11.10.2 Odor Control

Specific engineered controls will be employed as necessary during the work to control nuisance odors. These control measures include covering of stockpiles of soil, use of tarpaulins on trucks, limiting the extent of exposed surfaces containing odorous materials, and the use of odor suppressant foams. These foams will be employed within excavations, areas of stockpiling, and during the transport of potentially odorous materials.

##### 11.10.3 Sedimentation and Erosion Controls

Prior to the commencement of any Site work, hay bales and silt fencing will be installed downgradient (east side) along the waterfront, as well as along the north and south perimeter of the Site. A turbidity curtain will also be installed within the river prior to work along the banks of the river and during installation of the containment wall. Additional sedimentation and erosion control measures will be installed as necessary consistent with CRMC and Rhode Island

Pollutant Discharge Elimination System (RIPDES) requirements. The planned layout of these sedimentation and erosion control devices are shown on **Drawing 11** and details are provided in **Drawing 12**. These sedimentation and erosion control devices will be inspected at least weekly during implementation of the remedy and after each storm event with an intensity greater than 1-inch. Any deficiencies identified during these inspections will be addressed immediately.

#### 11.10.4 Soil Management Techniques

Dry (non-saturated) excavated materials will be staged on-Site directly on the existing ground surface in temporary working stockpiles no larger than 1,000 CY. Stockpiles will be covered with a layer of 10-mil polyethylene sheeting during the work days (to the extent practical) and during all non-working hours to control the generation of wind-blown dusts and potential migration of soils with stormwater runoff. Stockpile areas will be equipped with appropriate controls to limit the loss of the cover and protect against storm water erosion. These controls will include the installation of haybales or straw wattles surrounding the perimeter of the stockpiles and weighting the polyethylene cover with sand bags or concrete blocks. Stockpiles will be inspected at least daily by Site personnel.

Any saturated excavated materials will be temporarily staged on Site in a lined materials management area. The materials management area will be equipped with a bermed perimeter constructed with haybales or soil and the liner will extend over the top of the berms. The edges of the liner will be secured with sand bags or concrete block. Accumulated liquids will be removed from the saturated materials management area via pumping and containerized for off-Site disposal. Stockpiles will be covered with a layer of 10-mil polyethylene sheeting during the work days (to the extent practical) and during all non-working hours to control the generation of wind-blown dusts and potential migration of soils with stormwater runoff. Residual soils within the saturated materials management area will either be disposed off-Site or used as fill to achieve the subgrade for the engineered cap if sufficiently dry and stable.

#### 11.10.5 Off-Site Tracking Control and Site Security

Tracking pads/wheel wash stations will be installed and maintained to mitigate the off-Site tracking of sediments and other materials. The conceptual layout of the tracking pads/wheel wash stations are shown on **Drawing 11** and details are provided on **Drawing 12**.

The existing chain link fencing will be maintained around the perimeter of the Site to prevent access by the general public. In the event the work requires temporary removal of the existing chain link fencing, temporary construction fencing will be utilized to maintain a secure Site throughout the remedial work.

#### 11.11 AIR MONITORING PROGRAM

As indicated in Section 11.5 and documented in **Appendix H**, GZA performed an evaluation of potential volatile emissions during implementation of the RIDEM approved remedy. The results of this evaluation indicated that implementation of the remedy **does not** have the potential to increase emissions by greater than the minimum quantities specified in Appendix A of RIDEM APC Regulation No. 9, and, therefore, a minor source permit is not required for this activity.

During construction of the remedy, a state of the art, robust air monitoring program will be implemented to protect the surrounding community as well as Site workers from potential exposure to Site impacts. This program will provide continuous (24-hours per day, 7-days a week), real-time measurement of airborne concentrations of certain compounds that will allow rapid identification of conditions in the event elevated emissions are detected and the aggressive application of engineering controls to keep air quality parameters within acceptable limits. The air monitoring program will be designed generally consistent with the Site-specific AQMP established for the Tidewater Site and include both Tier

I (Real Time Monitoring) and Tier II (Time-Integrated Monitoring) with the objectives being to: (1) minimize exposure risks to both on-Site workers and the surrounding community associated with airborne constituents; (2) provide an early warning of Site conditions allowing oversight personnel to proactively manage potential air quality issues via implementation of engineered controls and/or adjustments to work practices/procedures; and (3) quantify air quality monitoring data for comparison to relevant action levels. The real time field data and the time integrated sampling results will be maintained on-Site during performance of the remedial work. In addition, this air monitoring data will be summarized in the *Remedial Action Closure Report*.

#### 11.11.1 Tier I - Real Time Monitoring

The real time monitoring program will involve the use of both portable, hand held instrumentation to continuously monitor active work zones where earth disturbing/stockpiling is occurring and the deployment of state of the art stationary air monitoring units along the perimeter of the Site.

Portable, hand held instrumentation will include PIDs (Photovac 2020) and particulate meters (DustTrak). PIDs measure total volatile organic compound concentrations by passing the air sample past an analytical detector and electronically measuring the resulting response. The PIDs are configured to respond to total organic compounds without any differentiation as to individual compound concentrations with a detection limit of 10 parts per billion by volume (ppbv). The DustTrack provides direct, real-time measurement of particulate (or dust) concentrations. The measurement of dust levels is accomplished using infrared electromagnetic radiation to sense airborne particles. Dust meters will be configured to respond only to dust particles < 10 micron in diameter (PM10) with a detection limit of 1 ug/m<sup>3</sup> (microgram per cubic meter).

The stationary perimeter air monitoring locations will be selected based on prevailing wind direction and the locations of nearby sensitive receptors. We currently anticipate the installation of 11 stations in the approximate locations depicted on **Drawing 11**. These units will be installed at the beginning of the remedial work and remain in place until the work is complete. The automated perimeter monitoring system will consist of individual monitoring stations with associated analytical instrumentation, a meteorological system, a computer control system, and an alarm system linked to the analytical instrumentation by an integrated communication/telemetry package. The instrumentation within each perimeter station located along the western and northern property boundaries (8 of 11 units) will consist of a gas chromatograph (GC) for the measurement of total VOCs (TVOCs) and benzene and a respirable particulate meter for the direct measurement of dust concentrations. The remaining 3 units will be located along the eastern property boundary proximate to the Seekonk River and will consist of a photoionization detector (PID) for the measurement of TVOCs and a respirable particulate meter for the measurement of dust. The instrumentation will be housed within weather tight enclosures that are environmentally controlled via individual heating and air conditioning systems. The system is also configured with onboard battery backup and a data logger allowing up to 8 hours of continuous recording in the event of power interruptions. Descriptions of the key analytical instruments within each station are provided below.

#### Gas Chromatographs

VOC concentrations on the western and northern property boundaries will be measured utilizing field gas chromatographs. The GCs measure volatile organic compounds by passing the air sample past an analytical detector and electronically measuring the resulting response. The GCs can be configured to operate in either TVOC mode or in a compound specific mode. In the TVOC mode, if the TVOC level exceeds a pre-determined value, the GC switches to a compound-specific analysis for measurement of individual compounds including benzene. The detection limit of the GC for individual compounds is 10 parts per billion (ppb).

During implementation of the remedy, the perimeter air monitoring stations on the western and northern property boundaries will be programmed to provide the on-Site operator a warning alarm when the average TVOC concentration over a 15-minute consecutive period exceeds 0.25 ppm (approximately 75% of the perimeter Action Level for benzene of 0.35 ppm established in the AQMP) and the GC will switch to directly measuring benzene concentrations. The deployment of the 8 GC units was specifically selected given their ability to more effectively and efficiently monitor potential benzene levels for this large-scale project when compared to the hand-held Voyager unit described in the AQMP.

#### Respirable Particulate

Direct-reading real-time particulate meters (ThermoMIE DataRam) will be used to monitor for particulates (or dust). The measurement of dust levels is accomplished using infrared electromagnetic radiation to sense airborne particles. The dust meter can be configured to respond only to dust particles < 10 micron in diameter (PM10), dust particles < 2.5 microns (PM2.5), or total suspended particulate.

During implementation of the remedy, the perimeter air monitoring stations will be programmed to provide the on-Site operator a warning alarm when the average particulate concentration over a 15-minute consecutive period exceeds 112  $\mu\text{g}/\text{m}^3$  (approximately 75% of the Action Level for respirable particulates of 150  $\mu\text{g}/\text{m}^3$  established in the AQMP).

#### Meteorological System

An on-Site meteorological tower (RM Young sensors) will be used to measure wind speed, direction, dry-bulb temperature, and relative humidity. The central computer system receives continuous information from the meteorological system and computes a 2-minute running average wind speed and direction value. The 2-minute running average wind direction will be used to identify which of the monitoring stations is upwind, downwind, or crosswind. This information is stored electronically, and printed out in daily reports.

#### Computer Control System

Data generated by the instrumentation, meteorological station, as well as operational parameters, will be continuously uploaded via radio telemetry links to a central computer system located in the Site construction trailer. The central computer system communicates with each perimeter monitoring station every minute to obtain the latest data values from the individual sensors. The retrieved data are then displayed on the central computer screen, and stored in a database along with the meteorological data and other operational status information. The monitoring data is automatically archived and used to print out summary graphs at the end of each day. The system will allow for communication between the instruments, environmental control equipment, meteorological station, alarm display, and the central computer.

The following table outlines the Action Levels for the Tier I monitoring previously established for the Tidewater Site in the AQMP. This table also outlines warning level alarm conditions for the perimeter air monitoring stations.

**Tier I – Warning and Action Levels – Real Time Monitoring**

COMPOUND	WORK ZONE PERIMETER	PROPERTY LINE <sup>1</sup>	
		WARNING LEVEL	ACTION LEVEL
Total VOCs	1.0 ppm	0.25 ppm <sup>2</sup>	0.5 ppm
Respirable Particulate (PM10)	1,000 ug/m <sup>3</sup>	112 ug/m <sup>3</sup>	150 ug/m <sup>3</sup>
Benzene	Not applicable	0.25 ppm	0.35 ppm

**Note:**

1. All warning and action levels for the property line are 15-minute average concentrations.
2. Upon reaching a 15-minute average concentration for TVOCs, the GC will switch to directly measuring benzene concentrations.

In the event the portable, hand-held air monitoring equipment at the perimeter of the work zone indicate exceedances of these action levels, engineered controls such as wetting or covering materials with tarpaulins or applying odor suppressing foams will be implemented to mitigate exposure risks of on-Site workers and to proactively mitigate potential exceedances at the perimeter of the Site. The Site perimeter air monitoring stations will be used to supplement the work zone monitoring to mitigate potential exposure risks to off-Site sensitive receptors and will be programmed to collect air quality measurements every minute. Based on these measurements, the air monitoring stations will automatically provide a warning alarm to the on-Site operator when TVOC concentrations exceed an average of 0.25 ppm over a 15-minute consecutive period and when particulate concentrations exceed an average of 112 µg/m<sup>3</sup> over a 15-minute consecutive period. These warning notifications will allow the source of the elevated levels to be identified and the subsequent implementation of engineered controls and/or modification of work practices before exceeding an action level.

11.11.2 Tier II - Time Integrated Sampling

The Tier II sampling program involves the collection and analysis of ambient air samples to routinely verify the Tier I results and provide a comparison to the RIDEM Acceptable Ambient Level (AALs) and the applicable action levels established in the Tidewater AQMP. Target compounds for the time integrated sampling include benzene, toluene, ethylbenzene, xylenes (BTEX), and naphthalene. Samples will be collected using SUMMA stainless steel canisters and analyzed via USEPA Method TO-15 by a certified laboratory. The SUMMA canister is passively filled with air via a mass flow controller which allows for uniform filling of the canister over an eight-hour sampling period. Time integrated air quality samples will be collected at the perimeter of the Site at an upwind and a downwind location based on the prevailing wind directions. At a minimum, samples will be collected on a weekly basis during earth disturbing/stockpiling activities. This sampling frequency is subject to modification based on the Tier I and Tier II monitoring results. The laboratory results will be available 48 hours after collection.

11.12 REGULATORY PERMITS/APPROVALS

We anticipate the following permits/approvals are necessary to implement the remedy.

- A CRMC Assent will be required since the Site is located within their 200-foot jurisdictional area. In addition, a variance consistent with Section 120 of the *Coastal Resources Management Program* will also be required due to grading/filling within 50-feet of the shoreline of the Seekonk River;
- A Rhode Island Pollutant Discharge Elimination System (RIPDES) *General Permit for Stormwater Discharges Associated with Construction Activities*;

- A *Water Quality Certification* to fulfill the requirements of Section 401 of the *Clean Water Act* since the remedial work involves considerable land disturbance adjacent to a coastal water body; and
- A NBC Sewer alteration permit since work associated with the containment wall will require alterations be made to the existing NBC CSO (combined sewer overflow) line that runs through the FPPA and discharges into the Seekonk River.

National Grid will submit applications to CRMC, RIDEM and NBC for these permits/approvals and Site remedial activities will not be initiated until these authorizations are received. Note: a preliminary permitting coordination meeting will be scheduled through RIDEM's Office of Customer and Technical Assistance with the various regulatory agencies prior to preparation of the permit applications necessary to implement the remedy.

As indicated above, GZA evaluated the applicability of RIDEM's *Air Pollution Control Regulation No. 9 – Air Pollution Control Permits* to the remedy. The results of this evaluation indicate that the remedial activities do not have the potential to increase emissions of listed air contaminants by greater than the minimum quantity specified in Appendix A of the regulations and a *Minor Source Permit* is therefore not required. The results of this evaluation are included in **Appendix H**.

#### **12.0 SET-UP PLANS (RULE 9.11)**

As indicated above, prior to the performance of any intrusive Site activities, sedimentation and erosion controls will be installed to mitigate the potential migration of Site materials. The layout of these sedimentation and erosion control devices are shown on **Drawing 11** and sedimentation and erosion control details are provided on **Drawing 12**.

An equipment staging area will be set-up on Site outside of the 200-foot zone regulated by the CRMC. This area will be utilized for light maintenance activities on the equipment and refueling operations. No construction vehicles actively will be fueled in a manner that would allow an inadvertent release to flow into the adjacent surface water. All oil, hydraulic fluid, or other hazardous materials will be stored in original containers; fuels will be stored in tightly sealed containers which are clearly marked; and all such material will be stored under a roof or in a covered enclosure.

#### **13.0 EFFLUENT DISPOSAL (RULE 9.12)**

To the extent practical, soils disturbed during the work will be used as on-Site fill to achieve the subgrade elevations for the engineered cap. In the event that excess soils are generated that cannot be used as on-Site fill, the soil will be disposed off-Site. Prior to off-Site disposal, composite samples will be collected from the stockpiled excess soil and analyzed based on the frequency and the parameters required by the selected disposal facility.

Any groundwater, NAPL, or stormwater collected during the work will be containerized in temporary storage tanks or fractionation tanks prior to off-Site disposal. Samples of the collected liquids will be collected and analyzed based on the frequency and the parameters required by the selected disposal facility. As an alternative, groundwater and/or collected stormwater generated during the work may be re-injected on-Site under a *Temporary Groundwater Discharge Approval* under Rule 13 of the October 2014 *Rules for the Discharge of Non-Sanitary Wastewater and Other Fluid to or Below the Ground Surface*. Based on the quality of the groundwater observed at the Site, dewatering fluids would be containerized within fractionation tanks and processed through filtration units for the removal of suspended solids prior to re-injection into the subsurface. Subsequent to removal of the suspended solids, the groundwater will be infiltrated into the ground surface proximate to the work area in a non-erosive manner using infiltration basins. The infiltration basins will be

constructed using geotextile fabric and haybales. We understand that discharge of dewatering fluids under Rule 13 will require prior review and approved by RIDEM.

Copies of all manifest(s) and Bills of Lading (BOLs) documenting the off-Site disposal of these materials will be included in the *Remedial Action Closure Report*.

#### 14.0 CONTINGENCY PLAN (RULE 9.13)

Unexpected conditions may be encountered during excavation. The following provides a listing of points of contacts in the event of an unexpected incident involving impacted soil and/or groundwater.

Firm	Contact	Address	Phone Number
GZA GeoEnvironmental, Inc.	David Rusczyk	655 Winding Brook Drive, Suite 402 Glastonbury, Connecticut 06033	(860) 858-3110 860-250-8556 (cell)
National Grid	Kenneth Lento	Project Manager National Grid 40 Sylvan Road Waltham, MA 02451	(781) 907-3655 (617) 791-2627 (cell)
Clean Harbors	Jim DeWolf	8 Dexter Road East Providence, RI 02914	(401) 265-3196 (cell)
RIDEM, DEM Project Manager	Joseph Martella	235 Promenade Street Providence, Rhode Island 02903	(401) 222-2797 Ext. 7109
RIDEM 24-Hour Emergency Response	NA	235 Promenade Street Providence, Rhode Island 02903	(401) 222-3070

GZA has prepared a *Contingency Plan/Health & Safety Plan*, attached as **Appendix I**, to address unanticipated conditions/incidents encountered at the property during construction. The *Contingency/Health & Safety Plan* is applicable to GZA personnel and will be available at the Site at all times during the implementation of the remedial action described herein. The Contractor selected to perform the work outlined in this report will be required to prepare and implement a Site-Specific Health and Safety Plan during the remediation activities as well.

#### 15.0 OPERATING LOG (RULE 9.14)

An Operating Log will be developed and maintained at the Site during the performance of the remedial work outlined herein. The log will subsequently be maintained by National Grid for a minimum period of three years. The Operating Log will include, at a minimum, the following information:

- Dates and time periods during which the remedial work described herein was performed;
- Daily Field Reports (DFRs) will be prepared during remedy implementation which will summarize personnel and equipment on-Site, work performed, health and safety monitoring conducted, results of air quality monitoring, etc.;
- Records of any laboratory analysis and field screening performed as part of the remedial action;
- Description of instances under which the Contingency Plan was implemented; and,

- Inspection reports detailing compliance with the remedial specifications described herein and the actions taken to address non-compliant practices/conditions.

A copy of the Operating Log will be provided to the Department at the completion of the project as part of the *Remedial Action Closure Report*. In addition, bi-weekly email updates regarding the status of the work being performed at the Site will be submitted to the Department during the remedial work and posted to the project's webpage.

#### **16.0 SECURITY PROCEDURES (RULE 9.15)**

Access to the Site during the remedial activities will be limited to National Grid, the engineering consultant, and the contractor and their sub-contractors performing the work. As indicated on **Drawing 11**, the existing chain-link fencing surrounding and within the Site will be used to restrict access to the soil disturbance areas. The existing chain-link fencing will be supplemented with temporary construction fencing as necessary to facilitate implementation of the remedy and to maintain a secure Site at all times. In addition, appropriate signage will be hung on two bulletin boards located adjacent to the Site as indicated on **Drawing 11**. The fencing will be locked at the end of each day as part of the daily shutdown procedures.

#### **17.0 SHUTDOWN, CLOSURE AND POST CLOSURE REQUIREMENTS (RULE 9.16)**

In the event that the remedial work is suspended for an extended period, (i.e., greater than 1 week), RIDEM will be notified. Daily shut-down procedures will include covering and securing of all soil stockpiles, as well as locking the internal and perimeter fencing.

Following completion of the remedial work, annual compliance inspections of the engineered caps, monitoring and recovery well network, fencing, and containment wall will be performed to ensure that the provisions of the ELUR are being maintained. In addition, routine NAPL gauging and recovery activities and natural attenuation groundwater monitoring will be performed consistent with the schedule outlined above. The results of these routine gauging, recovery, and monitoring activities will be documented in annual reports submitted to RIDEM.

#### **18.0 INSTITUTIONAL CONTROLS AND NOTICES (RULE 9.17)**

As indicated previously, public notice of the preferred remedy described herein was performed on June 13, 2017 consistent with Rule 7.07C of the *Remediation Regulations* subsequent to receipt of the Program Letter from RIDEM. Site abutters will be notified in writing at least one week prior to initiation of construction activities.

The ELUR described in Section 11.7 and included in **Appendix B** will be legally recorded on the land records for the Site. In addition, the property owner will maintain a copy of the ELUR and associated *Soil Management Plan*.

#### **19.0 COMPLIANCE DETERMINATION (RULE 9.18)**

As long as the remedial measures described in this plan are implemented and maintained, the Site will be considered to be in compliance with the *Remediation Regulations*. At the completion of the remedial construction activities described herein, a *Remedial Action Closure Report* will be submitted to RIDEM documenting the work performed.

To evaluate and record compliance with the provisions of the ELUR, a qualified environmental professional will evaluate the compliance status of the Site on an annual basis. Upon completion of the evaluation, the environmental professional will prepare and simultaneously submit to RIDEM, an evaluation report detailing the findings of the inspection and noting

any compliance violations at the Site. If the Property is determined to be out of compliance with the terms of the ELUR, the responsible party will submit a corrective action plan in writing to RIDEM within ten (10) days of receipt of the evaluation report, indicating the plans to bring the Site into compliance with the ELUR, including, at a minimum, a schedule for implementation of the plan.

#### 20.0 CERTIFICATION (RULE 9.19)

To address Rule 9.19 of the *Remediation Regulations*, the following statements of certification are provided.

*GZA GeoEnvironmental, Inc. certifies to the best of its knowledge, that this Remedial Action Work Plan is complete and accurate.*

A handwritten signature in blue ink that reads "James J. Clark".

James J. Clark  
Principal-In-Charge  
GZA GeoEnvironmental, Inc

*The Narragansett Electric Company certifies, to the best of its knowledge, that this Remedial Action Work Plan is a complete and accurate representation of the site and the release and contains all known facts surrounding the release.*

A handwritten signature in blue ink that reads "Elizabeth M. Greene".

Elizabeth M Greene  
Manager, Site Investigation and Remediation – New England  
The Narragansett Electric Company

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

**Detected concentrations are bolded.**

**Gray shaded cells indicates the concentration exceeds the RIDEM Method 1**

**Industrial/Commercial \Direct Exposure Criteria (I/C DEC).**

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

**A concentration with a bold border exceeds the Upper Concentration Limit.**

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

"E" qualifier indicates estimated concentration above the quantitation limit.

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

**Detected concentrations are bolded.**

**Gray shaded cells indicates the concentration exceeds the RIDEM Method 1**

**Industrial/Commercial \Direct Exposure Criteria (I/C DEC).**

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

**A concentration with a bold border exceeds the Upper Concentration Limit.**

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

"E" qualifier indicates estimated concentration above the quantitation limit.

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

**Detected concentrations are bolded.**

**Gray shaded cells indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial \Direct Exposure Criteria (I/C DEC).**

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

**A concentration with a bold border exceeds the Upper Concentration Limit.**

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

"E" qualifier indicates estimated concentration above the quantitation limit.

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

**Detected concentrations are bolded.**

**Gray shaded cells indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial \Direct Exposure Criteria (I/C DEC).**

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

**A concentration with a bold border exceeds the Upper Concentration Limit.**

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

"E" qualifier indicates estimated concentration above the quantitation limit.

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

**Detected concentrations are bolded.**

**Gray shaded cells indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial \Direct Exposure Criteria (I/C DEC).**

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

**A concentration with a bold border exceeds the Upper Concentration Limit.**

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

"E" qualifier indicates estimated concentration above the quantitation limit.

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

Detected concentrations are bolded.

Gray shaded cells indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial \Direct Exposure Criteria (I/C DEC).

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

**A concentration with a bold border** exceeds the Upper Concentration Limit.

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

"E" qualifier indicates estimated concentration above the quantitation limit.

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

**Detected concentrations are bolded.**

**Gray shaded cells indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial \Direct Exposure Criteria (I/C DEC).**

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

**A concentration with a bold border exceeds the Upper Concentration Limit.**

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

"E" qualifier indicates estimated concentration above the quantitation limit.

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

**Detected concentrations are bolded.**

**Gray shaded cells indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial \Direct Exposure Criteria (I/C DEC).**

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

**A concentration with a bold border exceeds the Upper Concentration Limit.**

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

"E" qualifier indicates estimated concentration above the quantitation limit.

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

Detected concentrations are bolded.

Gray shaded cells indicates the concentration exceeds the RIDEM Method 1

Industrial/Commercial Direct Exposure Criteria (I/C DEC).

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

A concentration with a bold border exceeds the Upper Concentration Limit.

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

"E" qualifier indicates estimated concentration above the quantitation limit.

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

Detected concentrations are bolded.

Gray shaded cells indicates the concentration exceeds the RIDEM Method 1

Industrial/Commercial Direct Exposure Criteria (I/C DEC).

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

A concentration with a bold border exceeds the Upper Concentration Limit.

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

"E" qualifier indicates estimated concentration above the quantitation limit.

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

Detected concentrations are bolded.

Gray shaded cells indicates the concentration exceeds the RIDEM Method 1

Industrial/Commercial \Direct Exposure Criteria (I/C DEC).

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

A concentration with a bold border exceeds the Upper Concentration Limit.

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

"E" qualifier indicates estimated concentration above the quantitation limit.

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

Detected concentrations are bolded.

Gray shaded cells indicates the concentration exceeds the RIDEM Method 1

Industrial/Commercial Direct Exposure Criteria (I/C DEC).

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

A concentration with a bold border exceeds the Upper Concentration Limit.

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

Detected concentrations are bolded.

Gray shaded cells indicates the concentration exceeds the RIDEM Method 1

Industrial/Commercial Direct Exposure Criteria (I/C DEC).

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

A concentration with a bold border exceeds the Upper Concentration Limit.

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

Detected concentrations are bolded.

Gray shaded cells indicates the concentration exceeds the RIDEM Method 1

Industrial/Commercial \Direct Exposure Criteria (I/C DEC).

Detection limits highlighted in blue and in italics exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

A concentration with a bold border exceeds the Upper Concentration Limit.

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

Notes

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

Detected concentrations are bolded.

Gray shaded cells indicates the concentration exceeds the RIDEM Method 1

Industrial/Commercial \Direct Exposure Criteria (I/C DEC).

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

**A concentration with a bold border exceeds the Upper Concentration Limit.**

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

**Detected concentrations are bolded.**

**Gray shaded cells indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial \Direct Exposure Criteria (I/C DEC).**

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

**A concentration with a bold border exceeds the Upper Concentration Limit.**

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

**Detected concentrations are bolded.**

**Gray shaded cells indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial \Direct Exposure Criteria (I/C DEC).**

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

**A concentration with a bold border exceeds the Upper Concentration Limit.**

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

Detected concentrations are bolded.

Gray shaded cells indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial \Direct Exposure Criteria (I/C DEC).

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

A concentration with a bold border exceeds the Upper Concentration Limit.

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

Detected concentrations are bolded.

Gray shaded cells indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial \Direct Exposure Criteria (I/C DEC).

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

**A concentration with a bold border exceeds the Upper Concentration Limit.**

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

Detected concentrations are bolded.

Gray shaded cells indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial \Direct Exposure Criteria (I/C DEC).

Detection limits highlighted in blue and in italics exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

A concentration with a bold border exceeds the Upper Concentration Limit.

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

**Notes**

NE = Not Established

NA = Not Analyzed

NFA = North Fill Area

FGPA = Former Gas Plant Area

FPPA = Former Power Plant Area

SFA = South Fill Area

**Detected concentrations are bolded.**

**Gray shaded cells indicates the concentration exceeds the RIDEM Method 1 Industrial/Commercial \Direct Exposure Criteria (I/C DEC).**

Detection limits highlighted in *blue and in italics* exceed the RIDEM Method 1 Criteria.

Underlined concentrations exceed the RIDEM Method 1 GB Leachability Criteria.

**A concentration with a bold border exceeds the Upper Concentration Limit.**

Undetected analytes have a "U" qualifier.

Any analytes reported from a diluted run of the original analysis have a "D" qualifier.

Blank cells indicate a sample was not analyzed for that parameter

BD-092817 is a blind duplicate for GZ-SS-FT-501

**IMPACTS LEGEND:**

- DEPTH OF SAMPLE
- TPH
- PAHs
- VOCs
- SAMPLE ONLY ANALYZED FOR NAPHTHALENE
- SAMPLE RESULT EXCEEDS GB LEACHABILITY CRITERIA
- SAMPLE RESULT EXCEEDS UPPER CONCENTRATION LIMIT
- PORTIONS OF SAMPLE OR ALL THE ANALYTICAL RESULTS WERE REJECTED (NOTE: NONE WERE REJECTED)
- SAMPLE WAS NOT ANALYZED FOR THIS PARAMETER
- NO EXCEEDANCES OF RIDEM CRITERIA AT THIS DEPTH
- SAMPLE RESULT EXCEEDS DIRECT EXPOSURE CRITERIA-INDUSTRIAL/COMMERCIAL

- GENERAL NOTES:**
- BASE MAP DEVELOPED FROM THE FOLLOWING:
    - ELECTRONIC CAD FILE 17-NG-52\_PAWTUCKET NO1 SUB TIDEWATER-JEG-07.DWG, TITLED "AS BUILT PLAN PAWTUCKET NO. 1 SUBSTATION," DATED AUGUST 22, 2017, ORIGINAL SCALE 1" = 20', CREATED BY TAUPER LAND SURVEY, INC. FOR NATIONAL GRID AND PROVIDED TO GZA ON SEPTEMBER 12, 2017.
    - ELECTRONIC CAD FILE AERO1408\_PROJECT.DWG, TITLED "DIGITAL PHOTOGRAMMETRIC MAPPING FOR TIDEWATER," DATED JUNE 27, 2016, ORIGINAL SCALE 1" = 40', CREATED BY AEROTECH CORP. FOR GZA.
    - ELECTRONIC CAD FILE 2016-161-AS-BUILT-MID-WAY.DWG, TITLED "SUBGRADE AS-BUILT PLAN," DATED JULY 2016, ORIGINAL SCALE 1" = 10', SHEET 1 OF 1, CREATED BY NATIONAL SURVEYORS-DEVELOPERS INC. AND PROVIDED BY NRC.
    - PROPERTY LINES AND LOT INFORMATION ESTABLISHED FROM INFORMATION PROVIDED ON A DRAWING TITLED "PERIMETER SURVEY OF LAND AT THE TIDEWATER FORMER MGP SITE IN PAWTUCKET, RHODE ISLAND FOR ATLANTIC ENVIRONMENTAL SERVICES INC." DEVELOPED BY LOUIS FEDERICI AND ASSOCIATES.
    - GIS DATA WAS PROVIDED BY THE CITY OF PAWTUCKET IN OCTOBER 2016 FOR REFERENCE PURPOSES ONLY AND SHOULD NOT BE CONSIDERED A LEGALLY AUTHORITY SOURCE AS TO LOCATION OF ANY LINE OR FEATURE. THESE DATA ARE FOR PLANNING PURPOSES ONLY AND DO NOT REPRESENT A LEGALLY RECORDED PLAN, DEED, SURVEY OR ENGINEERING SCHEMATIC AND ARE NOT INTENDED TO BE USED AS SUCH.
  - HORIZONTAL DATUM IS BASED ON NORTH AMERICAN DATUM 1983 (NAD83) FROM BASE MAPPING PROVIDED BY AEROTECH CORP.
  - VERTICAL DATUM IS BASED ON NORTH AMERICAN VERTICAL DATUM 1988 (NAVD88) FROM BASE MAPPING PROVIDED BY AEROTECH CORP.
  - ON-SITE INVESTIGATIONS AND SURVEYS BY GZA PERSONNEL DURING VARIOUS SITE VISITS BETWEEN 2016 AND 2018.
  - SITE BOUNDARIES ARE APPROXIMATE.

## **APPENDIX A**

### **LIMITATIONS**

## **GEOHYDROLOGICAL LIMITATIONS**

1. This Remedial Action Workplan has been prepared on behalf of and for the exclusive use of The Narragansett Electric Company d/b/a National Grid, solely for the Former Tidewater Facility located at terminus of Merry and Tidewater Streets in Pawtucket, Rhode Island ("Site") to address the requirements of Rule 9.00 of the Rhode Island Department of Environmental Management (RIDEM) Rules and Regulations for the Investigation and Remediation of Hazardous Materials Releases (*Remediation Regulations*) promulgated August 1996 and most recently amended in November 2011. This report and the findings contained herein shall not, in whole or in part, be disseminated or conveyed to any other party, nor used by any other party in whole or in part, without the prior written consent of GZA or National Grid.
2. GZA's work was performed in accordance with generally accepted practices of other consultants undertaking similar studies at the same time and in the same geographical area, and GZA observed that degree of care and skill generally exercised by other consultants under similar circumstances and conditions. GZA's findings and conclusions must be considered not as scientific certainties, but rather as our professional opinion concerning the significance of the limited data gathered during the course of the study. No other warranty, express or implied is made. Specifically, GZA does not and cannot represent that the Site contains no hazardous material, oil, or other latent condition beyond that observed by GZA during the 2012 Site investigation program.
3. The observations described in this report were made under the conditions stated therein. The conclusions presented in the report were based upon services performed and observations made by GZA.
4. In the event that National Grid or others authorized to use this report obtain information on environmental or hazardous waste issues at the Site not contained in this report, such information shall be brought to GZA's attention forthwith. GZA will evaluate such information and, on the basis of this evaluation, may modify the conclusions stated in this report.
5. The conclusions and recommendations contained in this report are based in part upon the data obtained from environmental samples obtained from relatively widely spread subsurface explorations. The nature and extent of variations between these explorations may not become evident until further exploration. If variations or other latent conditions then appear evident, it will be necessary to reevaluate the conclusions and recommendations of this report.

6. The generalized soil profile described in the text is intended to convey trends in subsurface conditions. The boundaries between strata are approximate and idealized and have been developed by interpretations of widely spaced explorations and samples; actual soil transitions are probably more gradual. For specific information, refer to the boring logs.
7. In the event this work included the collection of water level data, these readings have been made in the test pits, borings and/or observation wells at times and under conditions stated on the exploration logs. These data have been reviewed and interpretations have been made in the text of this report. However, it must be noted that fluctuations in the level of the groundwater may occur due to variations in rainfall and other factors different from those prevailing at the time measurements were made.
8. The conclusions contained in this report are based in part upon various types of chemical data and are contingent upon their validity. These data have been reviewed and interpretations made in the report. Moreover, it should be noted that variations in the types and concentrations of contaminants and variations in their flow paths may occur due to seasonal water table fluctuations, past disposal practices, the passage of time, and other factors. Should additional chemical data become available in the future, these data should be reviewed by GZA and the conclusions and recommendations presented herein modified accordingly.

## **APPENDIX B**

DRAFT ELUR AND SMP

~~Appendix G~~  
**APPENDIX B**  
**ENVIRONMENTAL LAND USAGE RESTRICTION**

This Declaration of Environmental Land Usage Restriction (“Restriction”) is made on this \_\_\_\_ day of \_\_\_\_\_, 20\_\_ by ~~[property owner]~~, the City of Pawtucket, and its successors and/or assigns (hereinafter, the “Grantor”).

**WITNESSETH:**

WHEREAS, the Grantor ~~\_\_\_\_\_ (name)~~, the City of Pawtucket is the Owner in fee simple of certain real property identified as ~~[specify the eastern portions of Assessor’s Plat 65B, Lot(s), address 648 and Town or City]~~ the eastern portions of Plat 67B, Lots 11 and 21 located in Pawtucket, Rhode Island (the “Property. These lots along with Assessor’s Plat 54B, Lot 826 and Assessor’s Plat 65B, Lots 645, 647, 649, and 662 owned by The Narragansett Electric Company are collectively identified as the Former Tidewater Facility (the “Site”), more particularly described in Exhibit A (Legal Description) which is attached hereto and made a part hereof; . Separate Environmental Land Usage Restrictions will be recorded on The Narragansett Electric Company owned lots;

WHEREAS, the ~~Property Site~~ (or portion thereof identified in the Class I survey which is attached hereto as Exhibit ~~2AA~~ and is made a part hereof) has been determined to ~~contain soil and/or groundwater which is contaminated with certain Hazardous Materials hazardous materials and/or petroleum in excess of applicable [residential or industrial/commercial Residential Direct Criteria, Industrial/Commercial Direct Exposure Criteria, and/or applicable groundwater the GB Groundwater objective]~~ criteria pursuant to the Rules and Regulations for the Investigation and Remediation of Hazardous Material Releases (“Remediation Regulations”);

WHEREAS, the Grantor and the Department have determined that the environmental land use restrictions set forth below are consistent with the regulations adopted by the Rhode Island Department of Environmental Management (“Department”) pursuant to R.I.G.L. § 23-19.14-1 and that this restriction shall be a Conservation Restriction pursuant to R.I.G.L. § 34-39--1 et. seq. and shall not be subject to the 30--year limitation provided in R.I.G.L. § 34-4-21;

WHEREAS, the Department's written approval of this Restriction is contained in the document entitled: ~~[Remedial Decision Letter/ Settlement Agreement/ Order of Approval/ Remedial Approval Letter]~~ issued on \_\_\_\_\_ pursuant to the Remediation Regulations and attached in Exhibit B;

WHEREAS, to prevent exposure to or migration of ~~Hazardous Substances hazardous substances~~ and to abate hazards to human health and/or the environment, and in accordance with the ~~[Remedial Decision Letter/ Remedial Agreement/ Order of Approval/ Remedial Approval Letter];~~, the Grantor desires to impose certain restrictions upon the use, occupancy, and activities of

and at the ~~{Property/Contaminated-Site}~~;

WHEREAS, the Grantor believes that this Restriction will effectively protect public health and the environment from such contamination; and

WHEREAS, the Grantor intends that such restrictions shall run with the land and be binding upon and enforceable against the Grantor and the Grantor's successors and assigns.

NOW, THEREFORE, Grantor agrees as follows:

A. **Restrictions Applicable to the ~~{Property/Contaminated-Site}~~:** In accordance with the ~~{Remedial Decision Letter/ Remedial Agreement/ Order of Approval/ Remedial Approval Letter}~~, the use, occupancy and activity of and at the ~~{Property/ Contaminated-Site}~~ is restricted as follows:

i. No ~~residential~~ use of the ~~{Property/Contaminated-Site}~~ including no vegetable gardens, licensed daycares, and elementary and secondary schools shall be permitted that is contrary to Department approvals and restrictions contained herein;

ii. No groundwater at the ~~{Property/Contaminated-Site}~~ shall be used as potable water or irrigation;

iii. ~~No~~ Neither the engineered controls nor the underlying soil at the ~~{Property/Contaminated-Site}~~ shall be disturbed in any manner without written permission of the Department's Office of Waste Management, except as permitted in ~~the Remedial Action Work Plan (RAWP) or~~ Section C below and in the Soil Management Plan (SMP) approved by the Department in a written approval letter dated \_\_\_\_\_ (date) \_\_\_\_\_ contained in Exhibit B ~~and~~ attached hereto;

iv. Humans engaged in activities at the ~~{Property/Contaminated-Site}~~ shall not be exposed to soils containing ~~Hazardous Materials~~ hazardous materials and/or petroleum in concentrations exceeding the applicable Department approved Direct Exposure Criteria set forth in the Remediation Regulations;

~~{vi. Water at the {Property/Contaminated-} No subsurface structures shall be constructed on the Site} shall be prohibited from infiltrating soils over groundwater containing Hazardous Materials~~ hazardous materials and/or petroleum in concentrations exceeding the applicable Department approved ~~leachability criteria set forth in the Remediation Regulations~~;

~~viii.v. \_\_\_\_\_ No subsurface structures shall be constructed on the {Property/Contaminated-Site} over groundwater containing Hazardous Materials and/or petroleum in concentrations exceeding the applicable Department approved GA or GB Groundwater Objectives set forth in the Remediation Regulations; without an engineered control to address potential vapor intrusion; and,~~

~~ix.vi.~~ \_\_\_\_ The engineered controls at the ~~[Property/ Contaminated-Site]~~ described in the ~~[RAWP or SMP]~~ contained in Exhibit ~~BD~~ attached hereto shall not be disturbed and shall be properly maintained to prevent humans engaged in ~~[residential or industrial/commercial]~~ activity from being exposed to soils containing ~~Hazardous Materials~~hazardous materials and/or petroleum in concentrations exceeding the applicable Department-approved ~~[residential or industrial/commercial]~~Industrial/Commercial Direct Exposure Criteria in accordance with the Remediation Regulations; ~~and.~~

~~[ii. The engineered controls at the [Property/ Contaminated-Site] described in the [RAWP or Soil Management Plan SMP] contained in Exhibit B attached hereto shall not be disturbed and shall be properly maintained so that water does not infiltrate soils containing Hazardous Materials and/or petroleum in concentrations exceeding the applicable Department approved leachability criteria set forth in the Remediation Regulations.~~

**~~D.B.~~** No action shall be taken, allowed, suffered, or omitted at the ~~[Property/ Contaminated-Site]~~ if such action or omission is reasonably likely to:

- i. Create a risk of migration of ~~Hazardous Materials~~hazardous materials and/or petroleum;
- ii. Create a potential hazard to human health or the environment; or
- iii. Result in the disturbance of any engineering controls utilized at the ~~[Property/Contaminated-Site]~~, except as permitted in the Department-approved ~~[RAWP or SMP]~~ contained in Exhibit ~~BD~~.

C. **Emergencies:** In the event of any emergency which presents a significant risk to human health or to the environment, including but not limited to, maintenance and repair of utility lines and other related appurtenances or a response to emergencies such as fire or flood, the application of Paragraphs A (~~iii. viii. -vi.~~) and B above may be suspended, provided such risk cannot be abated without suspending such Paragraphs and the Grantor complies with the following:

- i. \_\_\_\_ Grantor shall notify the Department's Office of Waste Management in writing of the emergency as soon as possible but no more than three (3) business days after Grantor's having learned of the emergency. (This does not remove Grantor's obligation to notify any other necessary state, local or federal agencies.);
- ii. \_\_\_\_ Grantor shall limit both the extent and duration of the suspension to the minimum period reasonable and necessary to adequately respond to the emergency;
- iii. \_\_\_\_ Grantor shall implement reasonable measures necessary to prevent actual, potential, present and future risk to human health and the environment resulting from such suspension;
- iv. \_\_\_\_ Grantor shall communicate at the time of written notification to the Department its

intention to conduct the Emergency Response Actions and provide a schedule to complete the Emergency Response Actions;

- v. \_\_\_ Grantor shall continue to implement the Emergency Response Actions, on the schedule submitted to the Department, to ensure that the ~~{Property/Contaminated-Site}~~ is remediated in accordance with the Remediation Regulations (or applicable variance) or restored to its condition prior to such emergency. Based upon information submitted to the Department at the time the ELUR was recorded pertaining to known environmental conditions at the ~~{Property/Contaminated-Site}~~, emergency maintenance and repair of utility lines and other related appurtenances shall only require restoration of the ~~{Property/Contaminated-Site}~~ to its condition prior to the maintenance and repair of the utility lines and other related appurtenances; and
- vi. \_\_\_ Grantor shall submit to the Department, within ten (10) days after the completion of the Emergency Response Action, a status report describing the emergency activities that have been completed.

**D. Release of Restriction; Alterations of Subject Area:** The Grantor shall not make, or allow or suffer to be made, any alteration of any kind in, to, or about any portion of the ~~{Property/Contaminated-Site}~~ inconsistent with this Restriction unless the Grantor has received the Department's prior written approval for such alteration. If the Department determines that the proposed alteration is significant, the Department may require the amendment of this Restriction. Alterations deemed insignificant -by the Department will be approved via a letter from the Department. The Department shall not approve any such alteration and shall not release the ~~{Property/Contaminated-Site}~~ from the provisions of this Restriction unless the Grantor demonstrates to the Department's satisfaction that Grantor has managed the ~~{Property/Contaminated-Site}~~ in accordance with applicable regulations.

**E. Notice of Lessees and Other Holders of Interests in the ~~{Property/Contaminated-Site}~~:** The Grantor, or any future holder of any interest in the ~~{Property/Contaminated-Site}~~, shall cause any lease, grant, or other transfer of any interest in the ~~{Property/Contaminated-Site}~~ to include a provision expressly requiring the lessee, grantee, or transferee to comply with this Restriction. The failure to include such provision shall not affect the validity or applicability of this Restriction to the ~~{Property/Contaminated-Site}~~.

**F. Enforceability:** If any court of competent jurisdiction determines that any provision of this Restriction is invalid or unenforceable, the Grantor shall notify the Department in writing within fourteen (14) days of such determination.

**G. Binding Effect:** All of the terms, covenants, and conditions of this Restriction shall run with the land and shall be binding on the Grantor, its successors and assigns, and each Owner and any other party entitled to control, possession or use of the ~~{Property/Contaminated-Site}~~ during such period of Ownership or possession.

**H. Inspection & Non-Compliance:** It shall be the obligation of the Grantor, or any future holder of any interest in the ~~{Property/Contaminated-Site}~~, to provide for annual inspections of the ~~{Property/Contaminated-Site}~~ for compliance with the ELUR in accordance with

Department requirements.

~~[An officer or Director of the company with direct knowledge of past and present conditions of the [Property/Contaminated-Site] (the “Company Representative”), or]~~ A qualified environmental professional will, on behalf of the Grantor or future holder of any interest in the ~~[Property/Contaminated-Site]~~, evaluate the compliance status of the ~~[Property/Contaminated-Site]~~ on an annual basis. Upon completion of the evaluation, the ~~[Company Representative or]~~ environmental professional will prepare and ~~simultaneously~~ submit to the Department and to the Grantor or future holder of any interest in the ~~[Property/Contaminated-Site]~~ an evaluation report detailing the findings of the inspection, and noting any compliance violations at the ~~[Property/Contaminated-Site]~~. If the ~~[Property/Contaminated-Site]~~ is determined to be out of compliance with the terms of the ELUR, the Grantor or future holder of any interest in the ~~[Property/Contaminated-Site]~~ shall submit a corrective action plan in writing to the Department within ten (10) days of receipt of the evaluation report, indicating the plans to bring the ~~[Property/Contaminated-Site]~~ into compliance with the ELUR, including, at a minimum, a schedule for implementation of the plan.

In the event of any violation of the terms of this Restriction, which remains uncured more than ninety (90) days after written notice of violation, all Department approvals and agreements relating to the ~~[Property/Contaminated-Site]~~ may be voided at the sole discretion of the Department.

- I. **Terms Used Herein:** The definitions of terms used herein shall be the same as the definitions contained in Section 3 (DEFINITIONS) of the Remediation Regulations.

~~Appendix G~~  
**APPENDIX B**  
**ENVIRONMENTAL LAND USAGE RESTRICTION**

This Declaration of Environmental Land Usage Restriction (“Restriction”) is made on this \_\_\_\_\_ day of \_\_\_\_\_, 20\_\_ by ~~[property owner]~~The Narragansett Electric Company, and its successors and/or assigns (hereinafter, the “Grantor”).

**WITNESSETH:**

WHEREAS, the Grantor ~~\_\_\_\_\_ (name)~~, The Narragansett Electric Company is the Owner in fee simple of certain real property identified as ~~[specify Assessor’s Plat, Lot(s), address 65B, Lots 645, 647, and Town or City]649~~ located in Pawtucket, Rhode Island ~~(, These lots along with the “Property Assessor’s Plat 54B, Lot 826 and Assessor’s Plat 65B, Lot 662 owned by The Narragansett Electric Company and the eastern portions of Assessor’s Plat 65B, Lot 648 and the eastern portions of Plat 67B, Lots 11 and 21 owned by the City of Pawtucket are collectively identified as the Former Tidewater Facility (the “Site”)~~, more particularly described in Exhibit A (Legal Description) which is attached hereto and made a part hereof. Separate Environmental Land Usage Restrictions will be recorded on Assessor’s Plat 54B, Lot 826 and Assessor’s Plat 65B, Lot 662 owned by The Narragansett Electric Company and the City of Pawtucket owned lots;

WHEREAS, the ~~Property Site~~ (or portion thereof identified in the Class I survey which is attached hereto as Exhibit ~~2AA~~ and is made a part hereof) has been determined to ~~contain soil and/or groundwater which is contaminated with certain Hazardous Materials hazardous materials and/or petroleum in excess of applicable [residential or industrial/commercial Residential Direct Criteria, Industrial/Commercial Direct Exposure Criteria, and/or applicable groundwater the GB Groundwater objective]~~ criteria pursuant to the Rules and Regulations for the Investigation and Remediation of Hazardous Material Releases (“Remediation Regulations”);

WHEREAS, the Grantor and the Department have determined that the environmental land use restrictions set forth below are consistent with the regulations adopted by the Rhode Island Department of Environmental Management (“Department”) pursuant to R.I.G.L. § 23-19.14-1 and that this restriction shall be a Conservation Restriction pursuant to R.I.G.L. § 34-39--1 et. seq. and shall not be subject to the 30-year limitation provided in R.I.G.L. § 34-4-21;

WHEREAS, the Department's written approval of this Restriction is contained in the document entitled: ~~[Remedial Decision Letter/ Settlement Agreement/ Order of Approval/ Remedial Approval Letter]~~ issued on \_\_\_\_\_ pursuant to the Remediation Regulations and attached in Exhibit B;

WHEREAS, to prevent exposure to or migration of ~~Hazardous Substances hazardous substances~~ and to abate hazards to human health and/or the environment, and in accordance with the

~~[Remedial Decision Letter/ Remedial Agreement/ Order of Approval/ Remedial Approval Letter]~~, the Grantor desires to impose certain restrictions upon the use, occupancy, and activities of and at the ~~[Property/Contaminated-Site]~~;

WHEREAS, the Grantor believes that this Restriction will effectively protect public health and the environment from such contamination; and

WHEREAS, the Grantor intends that such restrictions shall run with the land and be binding upon and enforceable against the Grantor and the Grantor's successors and assigns.

NOW, THEREFORE, Grantor agrees as follows:

**A. Restrictions Applicable to the ~~[Property/Contaminated-Site]~~:** In accordance with the ~~[Remedial Decision Letter/ Remedial Agreement/ Order of Approval/ Remedial Approval Letter]~~, the use, occupancy and activity of and at the ~~[Property/Contaminated-Site]~~ is restricted as follows:

- i. No residential use of the ~~[Property/Contaminated-Site]~~ including no vegetable gardens, licensed daycares, and elementary and secondary schools shall be permitted that is contrary to Department approvals and restrictions contained herein;
- ii. No groundwater at the ~~[Property/Contaminated-Site]~~ shall be used as potable water or irrigation;
- iii. ~~No~~ Neither the engineered controls nor the underlying soil at the ~~[Property/Contaminated-Site]~~ shall be disturbed in any manner without written permission of the Department's Office of Waste Management, except as permitted in ~~the Remedial Action Work Plan (RAWP) or~~ Section C below and in the Soil Management Plan (SMP) approved by the Department in a written approval letter dated \_\_\_\_\_ (date) contained in Exhibit B ~~and~~ attached hereto;
- iv. Humans engaged in activities at the ~~[Property/Contaminated-Site]~~ shall not be exposed to soils containing ~~Hazardous Materials~~ hazardous materials and/or petroleum in concentrations exceeding the applicable Department approved Direct Exposure Criteria set forth in the Remediation Regulations;
- ~~v. Water at the [Property/Contaminated-Site] shall be prohibited from infiltrating soils containing Hazardous Materials and/or petroleum in concentrations exceeding the applicable Department approved leachability criteria set forth in the Remediation Regulations;~~
- vii.v. No subsurface structures shall be constructed on the [Property/Contaminated-Site] over groundwater containing Hazardous Materials hazardous materials and/or petroleum in concentrations exceeding the applicable Department approved ~~GA or GB~~ Groundwater Objectives set forth in the Remediation Regulations; without an engineered control to address potential vapor intrusion; and,

~~viii.vi.~~ The engineered controls at the ~~{Property/ Contaminated-Site}~~ described in the ~~{RAWP or SMP}~~ contained in Exhibit ~~BD~~ attached hereto shall not be disturbed and shall be properly maintained to prevent humans engaged in ~~{residential or industrial/commercial}~~Industrial/Commercial activity from being exposed to soils containing ~~Hazardous Materials~~hazardous materials and/or petroleum in concentrations exceeding the applicable Department-approved ~~{residential or industrial/commercial}~~Industrial/Commercial Direct Exposure Criteria in accordance with the Remediation Regulations; ~~and.~~

~~{ii. The engineered controls at the {Property/ Contaminated-Site} described in the {RAWP or Soil Management Plan SMP} contained in Exhibit B attached hereto shall not be disturbed and shall be properly maintained so that water does not infiltrate soils containing Hazardous Materials and/or petroleum in concentrations exceeding the applicable Department approved leachability criteria set forth in the Remediation Regulations.~~

**D.B.** No action shall be taken, allowed, suffered, or omitted at the ~~{Property/ Contaminated-Site}~~ if such action or omission is reasonably likely to:

- i. Create a risk of migration of ~~Hazardous Materials~~hazardous materials and/or petroleum;
- ii. Create a potential hazard to human health or the environment; or
- iii. Result in the disturbance of any engineering controls utilized at the ~~{Property/Contaminated-Site}~~, except as permitted in the Department-approved ~~{RAWP or SMP}~~ contained in Exhibit ~~BD~~.

C. **Emergencies:** In the event of any emergency which presents a significant risk to human health or to the environment, including but not limited to, maintenance and repair of utility lines and other related appurtenances or a response to emergencies such as fire or flood, the application of Paragraphs A (~~iii. -viii. -vi.~~) and B above may be suspended, provided such risk cannot be abated without suspending such Paragraphs and the Grantor complies with the following:

- i. Grantor shall notify the Department's Office of Waste Management in writing of the emergency as soon as possible but no more than three (3) business days after Grantor's having learned of the emergency. (This does not remove Grantor's obligation to notify any other necessary state, local or federal agencies.);
- ii. Grantor shall limit both the extent and duration of the suspension to the minimum period reasonable and necessary to adequately respond to the emergency;
- iii. Grantor shall implement reasonable measures necessary to prevent actual, potential, present and future risk to human health and the environment resulting from such suspension;

- iv. \_\_\_ Grantor shall communicate at the time of written notification to the Department its intention to conduct the Emergency Response Actions and provide a schedule to complete the Emergency Response Actions;
- v. \_\_\_ Grantor shall continue to implement the Emergency Response Actions, on the schedule submitted to the Department, to ensure that the ~~{Property/Contaminated-Site}~~ is remediated in accordance with the Remediation Regulations (or applicable variance) or restored to its condition prior to such emergency. Based upon information submitted to the Department at the time the ELUR was recorded pertaining to known environmental conditions at the ~~{Property/Contaminated-Site}~~,<sup>2</sup> emergency maintenance and repair of utility lines and other related appurtenances shall only require restoration of the ~~{Property/Contaminated-Site}~~ to its condition prior to the maintenance and repair of the utility lines and other related appurtenances; and
- vi. \_\_\_ Grantor shall submit to the Department, within ten (10) days after the completion of the Emergency Response Action, a status report describing the emergency activities that have been completed.

**D. Release of Restriction; Alterations of Subject Area:** The Grantor shall not make, or allow or suffer to be made, any alteration of any kind in, to, or about any portion of the ~~{Property/Contaminated-Site}~~ inconsistent with this Restriction unless the Grantor has received the Department's prior written approval for such alteration. If the Department determines that the proposed alteration is significant, the Department may require the amendment of this Restriction. Alterations deemed insignificant -by the Department will be approved via a letter from the Department. The Department shall not approve any such alteration and shall not release the ~~{Property/Contaminated-Site}~~ from the provisions of this Restriction unless the Grantor demonstrates to the Department's satisfaction that Grantor has managed the ~~{Property/Contaminated-Site}~~ in accordance with applicable regulations.

**E. Notice of Lessees and Other Holders of Interests in the ~~{Property/Contaminated-Site}~~:** The Grantor, or any future holder of any interest in the ~~{Property/Contaminated-Site}~~,<sup>2</sup> shall cause any lease, grant, or other transfer of any interest in the ~~{Property/Contaminated-Site}~~ to include a provision expressly requiring the lessee, grantee, or transferee to comply with this Restriction. The failure to include such provision shall not affect the validity or applicability of this Restriction to the ~~{Property/Contaminated-Site}~~.

**F. Enforceability:** If any court of competent jurisdiction determines that any provision of this Restriction is invalid or unenforceable, the Grantor shall notify the Department in writing within fourteen (14) days of such determination.

**G. Binding Effect:** All of the terms, covenants, and conditions of this Restriction shall run with the land and shall be binding on the Grantor, its successors and assigns, and each Owner and any other party entitled to control, possession or use of the ~~{Property/Contaminated-Site}~~ during such period of Ownership or possession.

**H. Inspection & Non-Compliance:** It shall be the obligation of the Grantor, or any future holder

of any interest in the ~~{Property/Contaminated-Site}~~, to provide for annual inspections of the ~~{Property/Contaminated-Site}~~ for compliance with the ELUR in accordance with Department requirements.

~~[An officer or Director of the company with direct knowledge of past and present conditions of the {Property/Contaminated-Site} (the "Company Representative"), or]~~ A qualified environmental professional will, on behalf of the Grantor or future holder of any interest in the ~~{Property/Contaminated-Site}~~, evaluate the compliance status of the ~~{Property/Contaminated-Site}~~ on an annual basis. Upon completion of the evaluation, the ~~{Company Representative or}~~ environmental professional will prepare and ~~simultaneously~~ submit to the Department and to the Grantor or future holder of any interest in the ~~{Property/Contaminated-Site}~~ an evaluation report detailing the findings of the inspection, and noting any compliance violations at the ~~{Property/Contaminated-Site}~~. If the ~~{Property/Contaminated-Site}~~ is determined to be out of compliance with the terms of the ELUR, the Grantor or future holder of any interest in the ~~{Property/Contaminated-Site}~~ shall submit a corrective action plan in writing to the Department within ten (10) days of receipt of the evaluation report, indicating the plans to bring the ~~{Property/Contaminated-Site}~~ into compliance with the ELUR, including, at a minimum, a schedule for implementation of the plan.

In the event of any violation of the terms of this Restriction, which remains uncured more than ninety (90) days after written notice of violation, all Department approvals and agreements relating to the ~~{Property/Contaminated-Site}~~ may be voided at the sole discretion of the Department.

- I. Terms Used Herein:** The definitions of terms used herein shall be the same as the definitions contained in Section 3 (DEFINITIONS) of the Remediation Regulations.

~~Appendix G~~  
**APPENDIX B**  
**ENVIRONMENTAL LAND USAGE RESTRICTION**

This Declaration of Environmental Land Usage Restriction (“Restriction”) is made on this \_\_\_\_ day of \_\_\_\_\_, 20\_\_ by ~~[property owner]~~The Narragansett Electric Company, and its successors and/or assigns (hereinafter, the “Grantor”).

**WITNESSETH:**

WHEREAS, the Grantor ~~\_\_\_\_\_ (name)~~, The Narragansett Electric Company is the Owner in fee simple of certain real property identified as ~~[specify Assessor’s Plat 54B, Lot(s), address 826 and Town or City]~~Plat 65B, Lot 662 located in Pawtucket, Rhode Island ( These lots along with the “Property Assessor’s Plat 65B, Lots 645, 647, and 649 owned by The Narragansett Electric Company and the eastern portions of Assessor’s Plat 65B, Lot 648 and the eastern portions of Plat 67B, Lots 11 and 21 owned by the City of Pawtucket are collectively identified as the Former Tidewater Facility (the “Site”), more particularly described in Exhibit A (Legal Description) which is attached hereto and made a part hereof. Separate Environmental Land Usage Restrictions will be recorded on Assessor’s Plat 65B, Lots 645, 647, and 649 owned by The Narragansett Electric Company and the City of Pawtucket owned lots;

WHEREAS, the ~~Property Site~~ (or portion thereof identified in the Class I survey which is attached hereto as Exhibit ~~2AA~~ and is made a part hereof) has been determined to ~~contain soil and/or groundwater which is contaminated with certain Hazardous Materials hazardous materials and/or petroleum in excess of applicable [residential or industrial/commercial Residential Direct Criteria, Industrial/Commercial Direct Exposure Criteria, and/or applicable groundwater the GB Groundwater objective]~~ criteria pursuant to the Rules and Regulations for the Investigation and Remediation of Hazardous Material Releases (“Remediation Regulations”);

WHEREAS, the Grantor and the Department have determined that the environmental land use restrictions set forth below are consistent with the regulations adopted by the Rhode Island Department of Environmental Management (“Department”) pursuant to R.I.G.L. § 23-19.14-1 and that this restriction shall be a Conservation Restriction pursuant to R.I.G.L. § 34-39--1 et. seq. and shall not be subject to the 30-~~year~~ limitation provided in R.I.G.L. § 34-4-21;

WHEREAS, the Department's written approval of this Restriction is contained in the document entitled: ~~[Remedial Decision Letter/ Settlement Agreement/ Order of Approval/ Remedial Approval Letter]~~ issued on \_\_\_\_\_ pursuant to the Remediation Regulations and attached in Exhibit B;

WHEREAS, to prevent exposure to or migration of ~~Hazardous Substances hazardous substances~~ and to abate hazards to human health and/or the environment, and in accordance with the ~~[Remedial Decision Letter/ Remedial Agreement/ Order of Approval/ Remedial Approval~~

~~Letter~~, the Grantor desires to impose certain restrictions upon the use, occupancy, and activities of and at the ~~{Property/Contaminated-Site}~~;

WHEREAS, the Grantor believes that this Restriction will effectively protect public health and the environment from such contamination; and

WHEREAS, the Grantor intends that such restrictions shall run with the land and be binding upon and enforceable against the Grantor and the Grantor's successors and assigns.

NOW, THEREFORE, Grantor agrees as follows:

**A. Restrictions Applicable to the ~~{Property/Contaminated-Site}~~:** In accordance with the ~~{Remedial Decision Letter/ Remedial Agreement/ Order of Approval/ Remedial Approval Letter}~~, the use, occupancy and activity of and at the ~~{Property/ Contaminated-Site}~~ is restricted as follows:

- i. ~~Restricted Residential Activity (as defined herein) is allowed and provides for passive recreational use but prohibits certain uses/activities including occupied residences at grade level, vegetable gardens, licensed daycares, and elementary and secondary schools (collectively, "Restricted Residential Activity").~~ No residential use of the ~~{Property/Contaminated-Site}~~ shall be permitted that is contrary to Department approvals and/or restrictions including Restricted Residential Activity contained herein;
- ii. No groundwater at the ~~{Property/Contaminated-Site}~~ shall be used as potable water or irrigation;
- iii. ~~No~~Neither the engineered controls nor the underlying soil at the ~~{Property/Contaminated-Site}~~ shall be disturbed in any manner without written permission of the Department's Office of Waste Management, except as permitted in ~~the Remedial Action Work Plan (RAWP) or~~ Section C below and in the Soil Management Plan (SMP) approved by the Department in a written approval letter dated \_\_\_\_\_ (date) \_\_\_\_\_ contained in Exhibit B ~~and~~ attached hereto;
- iv. Humans engaged in activities at the ~~{Property/Contaminated-Site}~~ shall not be exposed to soils containing ~~Hazardous Materials~~ hazardous materials and/or petroleum in concentrations exceeding the applicable Department approved Direct Exposure Criteria set forth in the Remediation Regulations;
- ~~v. Water at the {Property/Contaminated-Site} shall be prohibited from infiltrating soils containing Hazardous Materials and/or petroleum in concentrations exceeding the applicable Department approved leachability criteria set forth in the Remediation Regulations;~~
- vii-v. \_\_\_\_\_ No subsurface structures shall be constructed on the ~~{Property/Contaminated-Site}~~ over groundwater containing ~~Hazardous Materials~~ hazardous materials and/or petroleum in concentrations exceeding the applicable Department approved ~~GA or~~ GB Groundwater

Objectives set forth in the Remediation Regulations; ~~without an engineered control to address potential vapor intrusion~~; and,

~~viii.vi.~~ vi. The engineered controls at the ~~{Property/ Contaminated-Site}~~ described in the ~~{RAWP or SMP}~~ contained in Exhibit ~~BD~~ attached hereto shall not be disturbed and shall be properly maintained to prevent humans engaged in ~~{residential}~~ Restricted Residential Activity or ~~industrial/commercial~~ Industrial/Commercial activity from being exposed to soils containing ~~Hazardous Materials~~ hazardous materials and/or petroleum in concentrations exceeding the applicable Department-approved ~~{residential}~~ Residential or ~~industrial/commercial~~ Industrial/Commercial Direct Exposure Criteria in accordance with the Remediation Regulations; ~~and.~~

~~[ii. The engineered controls at the {Property/ Contaminated-Site} described in the {RAWP or Soil Management Plan SMP} contained in Exhibit B attached hereto shall not be disturbed and shall be properly maintained so that water does not infiltrate soils containing Hazardous Materials and/or petroleum in concentrations exceeding the applicable Department-approved leachability criteria set forth in the Remediation Regulations.~~

**D.B.** No action shall be taken, allowed, suffered, or omitted at the ~~{Property/ Contaminated-Site}~~ if such action or omission is reasonably likely to:

- i. Create a risk of migration of ~~Hazardous Materials~~ hazardous materials and/or petroleum;
- ii. Create a potential hazard to human health or the environment; or
- iii. Result in the disturbance of any engineering controls utilized at the ~~{Property/Contaminated-Site}~~, except as permitted in the Department-approved ~~{RAWP or SMP}~~ contained in Exhibit ~~BD~~.

C. **Emergencies:** In the event of any emergency which presents a significant risk to human health or to the environment, including but not limited to, maintenance and repair of utility lines and other related appurtenances or a response to emergencies such as fire or flood, the application of Paragraphs A (~~iii. viii.-vi.~~) and B above may be suspended, provided such risk cannot be abated without suspending such Paragraphs and the Grantor complies with the following:

- i. \_\_\_ Grantor shall notify the Department's Office of Waste Management in writing of the emergency as soon as possible but no more than three (3) business days after Grantor's having learned of the emergency. (This does not remove Grantor's obligation to notify any other necessary state, local or federal agencies.);
- ii. \_\_\_ Grantor shall limit both the extent and duration of the suspension to the minimum period reasonable and necessary to adequately respond to the emergency;
- iii. \_\_\_ Grantor shall implement reasonable measures necessary to prevent actual, potential, present and future risk to human health and the environment resulting from such

suspension;

- iv. \_\_\_ Grantor shall communicate at the time of written notification to the Department its intention to conduct the Emergency Response Actions and provide a schedule to complete the Emergency Response Actions;
- v. \_\_\_ Grantor shall continue to implement the Emergency Response Actions, on the schedule submitted to the Department, to ensure that the ~~{Property/Contaminated-Site}~~ is remediated in accordance with the Remediation Regulations (or applicable variance) or restored to its condition prior to such emergency. Based upon information submitted to the Department at the time the ELUR was recorded pertaining to known environmental conditions at the ~~{Property/Contaminated-Site}~~,<sup>2</sup> emergency maintenance and repair of utility lines and other related appurtenances shall only require restoration of the ~~{Property/Contaminated-Site}~~ to its condition prior to the maintenance and repair of the utility lines and other related appurtenances; and
- vi. \_\_\_ Grantor shall submit to the Department, within ten (10) days after the completion of the Emergency Response Action, a status report describing the emergency activities that have been completed.

**D. Release of Restriction; Alterations of Subject Area:** The Grantor shall not make, or allow or suffer to be made, any alteration of any kind in, to, or about any portion of the ~~{Property/Contaminated-Site}~~ inconsistent with this Restriction unless the Grantor has received the Department's prior written approval for such alteration. If the Department determines that the proposed alteration is significant, the Department may require the amendment of this Restriction. Alterations deemed insignificant -by the Department will be approved via a letter from the Department. The Department shall not approve any such alteration and shall not release the ~~{Property/Contaminated-Site}~~ from the provisions of this Restriction unless the Grantor demonstrates to the Department's satisfaction that Grantor has managed the ~~{Property/Contaminated-Site}~~ in accordance with applicable regulations.

**E. Notice of Lessees and Other Holders of Interests in the ~~{Property/Contaminated-Site}~~:** The Grantor, or any future holder of any interest in the ~~{Property/Contaminated-Site}~~,<sup>2</sup> shall cause any lease, grant, or other transfer of any interest in the ~~{Property/Contaminated-Site}~~ to include a provision expressly requiring the lessee, grantee, or transferee to comply with this Restriction. The failure to include such provision shall not affect the validity or applicability of this Restriction to the ~~{Property/Contaminated-Site}~~.

**F. Enforceability:** If any court of competent jurisdiction determines that any provision of this Restriction is invalid or unenforceable, the Grantor shall notify the Department in writing within fourteen (14) days of such determination.

**G. Binding Effect:** All of the terms, covenants, and conditions of this Restriction shall run with the land and shall be binding on the Grantor, its successors and assigns, and each Owner and any other party entitled to control, possession or use of the ~~{Property/Contaminated-Site}~~ during such period of Ownership or possession.

**H. Inspection & Non-Compliance:** It shall be the obligation of the Grantor, or any future holder of any interest in the ~~[Property/Contaminated-Site]~~,<sub>2</sub> to provide for annual inspections of the ~~[Property/Contaminated-Site]~~ for compliance with the ELUR in accordance with Department requirements.

~~[An officer or Director of the company with direct knowledge of past and present conditions of the [Property/Contaminated-Site] (the “Company Representative”), or]~~ A qualified environmental professional will, on behalf of the Grantor or future holder of any interest in the ~~[Property/Contaminated-Site]~~,<sub>2</sub> evaluate the compliance status of the ~~[Property/Contaminated-Site]~~ on an annual basis. Upon completion of the evaluation, the ~~[Company Representative or]~~ environmental professional will prepare and ~~simultaneously~~ submit to the Department and to the Grantor or future holder of any interest in the ~~[Property/Contaminated-Site]~~ an evaluation report detailing the findings of the inspection, and noting any compliance violations at the ~~[Property/Contaminated-Site]~~. If the ~~[Property/Contaminated-Site]~~ is determined to be out of compliance with the terms of the ELUR, the Grantor or future holder of any interest in the ~~[Property/Contaminated-Site]~~ shall submit a corrective action plan in writing to the Department within ten (10) days of receipt of the evaluation report, indicating the plans to bring the ~~[Property/Contaminated-Site]~~ into compliance with the ELUR, including, at a minimum, a schedule for implementation of the plan.

In the event of any violation of the terms of this Restriction, which remains uncured more than ninety (90) days after written notice of violation, all Department approvals and agreements relating to the ~~[Property/Contaminated-Site]~~ may be voided at the sole discretion of the Department.

**I. Terms Used Herein:** The definitions of terms used herein shall be the same as the definitions contained in Section 3 (DEFINITIONS) of the Remediation Regulations.

**EXHIBIT D**  
**SOIL MANAGEMENT PLAN**  
Former Tidewater Facility  
Pawtucket, Rhode Island

This *Soil Management Plan* (SMP) has been prepared to establish procedures to be followed during future construction and/or maintenance activities that require management of impacted materials (soil and groundwater) at the Former Tidewater Facility located in Pawtucket, Rhode Island (referred to herein as the “Site”). The Former Tidewater Facility is identified as Assessor’s Plat (AP) 54B, Lot 826 and AP 65B, Lots 662, 645, 647 and 649 owned by The Narragansett Electric Company and the eastern portions of AP 65B, Lot 648 and AP 67B Lots 11 and 21 owned by the City of Pawtucket.

A Rhode Island Department of Environmental Management (RIDEM) approved *Public Involvement Plan* (PIP) dated October 2013 has been prepared for this Site consistent with the requirements of the RIDEM *Remediation Regulations*. This PIP establishes procedures regarding how information related to the investigation and clean-up of the Tidewater Site will be shared with the public and how the public will be able to comment on plans for assessment and cleanup of the Site. The PIP is not intended to cover emergency activities or day to day facility operations, including repair and maintenance of the natural gas regulator facility and electrical substation involving minor soil disturbances. This PIP should be reviewed for specific requirements prior to any planned activities where disturbance of the engineered controls is required.

A Site-specific *Air Quality Monitoring Plan* (AQMP) has been prepared for the Tidewater Site. This plan was developed to provide for a consistent approach to air monitoring during certain relatively short duration remediation, construction, and maintenance related activities. This AQMP should be reviewed for specific air monitoring requirements prior to performance of earth disturbing activities.

The restrictions established for the Site are described in Section A of the ELUR. As described in Section A of the ELUR, neither the engineered controls nor the underlying impacted soils at the Site shall be disturbed in any manner without prior written permission from RIDEM’s Office of Waste Management. The “engineered controls” are defined as follows:

- The engineered cap in the paved portions of the Site consists of a minimum 2-inch layer of top course and a minimum 2-inch layer of binder course installed directly over the existing asphalt surface. These paved capped areas are limited to the area to the west and north of the Pawtucket No. 1 substation building;
- In the northern portion of the Site, the engineered cap consists of a permeable cap with a minimum 6-inch layer of topsoil underlain by a minimum 6-inch layer of compacted granular fill underlain by a geotextile fabric that acts as a warning barrier;
- An impermeable cap consisting of a minimum 6-inch layer of topsoil (northern portion) or 6-inch thick layer of gravel (southern portion) underlain by a minimum 18-inch layer of

processed gravel, sand or other clean fill underlain by a liner system which includes a doubled-sided composite drainage net, a 40-mil HDPE liner, and an 8 oz non-woven geotextile;

- A crushed stone permeable cap consisting of a minimum 6-inch layer of crushed stone underlain by a minimum 6-inch layer of compacted granular fill underlain by a geotextile fabric that acts as a warning barrier to the east of the Pawtucket No. 1 substation building and the substation;
- Along portions of the riverfront, in the western portion of the NFA, and west of the natural gas regulating station, the engineered cap consists of a minimum 12-inch layer of RIDOT R-3 rip rap underlain by a geotextile fabric that acts as a warning barrier;
- The access road to the south of the substation and the staging area proximate to the transmission towers consists of a minimum 6-inch layer of compacted granular fill underlain by a minimum 18-inch layer of processed gravel, sand or clean fill underlain by a linear system which includes a doubled-sided composite drainage net, a 40-mil HDPE liner, and an 8 oz non-woven geotextile underlain by existing soil subgrade; and,
- Chain link fencing serves as an engineered control to restrict access to certain portions of the Site. The layout of this engineered control fencing is depicted on Figure 1.

In addition, a network of monitoring and recovery wells and a containment wall are present on the Site. The attached Figure 1 depicts the extent of the engineered controls, as well as the locations of the monitoring and recovery wells and the containment wall.

This SMP is organized as follows:

- Section 1.0 describes notification and reporting required by RIDEM;
- Section 2.0 describes the Site and provides relevant background information;
- Section 3.0 presents a summary of the Site hydrogeologic features;
- Section 4.0 summarizes soil and groundwater quality data;
- Section 5.0 presents soil and groundwater management requirements; and
- Section 6.0 presents health and safety requirements.

## **1.0 NOTIFICATION**

In the event of an activity involving disturbance of impacted soil beneath the engineered caps, disturbance of the engineered control fencing, or the disturbance of surface soils on the steep slopes along the western edges of AP 65B Lots 645, 647, and 649 and the eastern portions of AP 65B, Lot 648, and AP67B Lots 11 and 21, The Narragansett Electric Company shall provide a written description to RIDEM of the anticipated activity (referred to herein as the "Notification"). The Notification must be submitted to RIDEM no later than **60 days** prior to the proposed initiation of activities. At a minimum, the Notification shall include: a description of the activity; an estimate of the areal extent and depth of disturbance; the estimated volume of soil to be excavated/disturbed; a list of the known and anticipated contaminants of concern; a drawing clearly identifying the proposed areas and depths to be excavated/disturbed; impacted

soil (if applicable) management/handling/disposal procedures; description of plans to manage, contain, treat, and discharge or dispose of groundwater (if necessary); restoration procedures (including engineered control replacement/repair); and the anticipated duration of the project. Please note: these notification requirements do not apply to emergencies or routine maintenance or repair activities necessary to maintain operation of the active natural gas regulating station, active electrical substation located on the Site, or other active utilities on the Site.

Work associated with the Notification shall not commence until written RIDEM approval has been issued. As indicated previously, the requirements of the Site-specific PIP established for the Tidewater Site shall also be reviewed and implemented as necessary and as applicable. Once RIDEM approval has been issued, RIDEM shall be notified a minimum of two (2) days prior to the start of activities at the Site. If significant alterations to the RIDEM-approved plan are necessary, a written description of the proposed deviation shall be submitted to RIDEM for review and approval prior to initiation of work.

Following written Notification, RIDEM will determine the post closure reporting requirements. Following written Notification, RIDEM may determine that minor disturbances of impacted soil may be documented through the annual evaluation submitted in accordance with Section H (Inspection & Non-Compliance) of the RIDEM-approved ELUR. RIDEM will also make a determination regarding whether Public Notice to the abutting Site owners/tenants concerning the proposed activities will be required. Significant disturbances of impacted soil may require submission of a *Closure Report* for RIDEM's review and approval documenting that the activities were performed in accordance with this SMP and the RIDEM-approved ELUR.

## **2.0 SITE DESCRIPTION/BACKGROUND**

The following provides a brief description and history of the Site and a summary of relevant past operations. For more detailed information, please refer to the January 2011 *Site Investigation Data Report* (SIDR) prepared by GZA GeoEnvironmental, Inc. (GZA) on behalf of The Narragansett Electric Company which is on file with RIDEM.

The Former Tidewater Facility consists of approximately 23 acres across eight separate lots located between Taft Street, an extension of Tidewater and Thorton Streets to the west, and the Seekonk River to the east. The Site is secured with a locked perimeter chain-link fence. The Site has been subdivided into four areas, as described below.

- North Fill Area (NFA) (northern portions of A.P. 54B Lot 826);
- Former Gas Plant Area (FGPA) (southern portions of A.P. 54B Lot 826 and A.P. 65B Lot 662);
- Former Power Plant Area (FPPA) (A.P. 65B Lot 645); and the
- South Fill Area (SFA) (A.P. 65B Lots 647 and 649, portions of Lot 648, and portions of A.P. 67B Lots 11 and 21).

The Site was the location of a former Manufactured Gas Plant (MGP) which operated from approximately 1880 to 1968. From the 1880s until 1954, the MGP generated gas using the coal carbonization and carbureted water gas processes. In the later years of operation (1954 until the late-1960s), the MGP produced gas for peak shaving purposes. In 1968, the MGP facility was decommissioned. Based on available information, it appears that the majority of the aboveground MGP structures and tanks were razed at that time or before. The last of the two remaining gasholders (Nos. 7 and 8) were decommissioned and removed in 2010. Presently, there is an active natural gas regulating station located in the southwestern corner of the FGPA.

In 1890, the Pawtucket Gas Company commenced building the Pawtucket No. 1 Station for power generation purposes. The No. 1 Station operated from the early-1890s until 1975. Based on a review of aerial photographs, the current transformer yard was part of this electrical generation plant since at least 1939. The station used coal and petroleum-based products for electricity generation. In addition, the plant used residual byproduct tar from the MGP for power generation. Presently, two electrical transmission towers, a substation and the Pawtucket No. 1 substation building are located in the FPPA.

Chain link fencing surrounds the northern, western, and southern edges of the Site (Perimeter Fencing) and the substation area, the Pawtucket No. 1 substation building, the transmission towers, and the natural gas regulator station. In addition, chain link fencing restricts access to certain portions of the Site (Engineered Control Fencing). The layout of this chain link fencing is depicted on Figure 1.

### **3.0 HYDROGEOLOGIC CONDITIONS**

Stratigraphy across the Site generally consists of fill materials underlain by stratified gravel, sands, silt and clay, underlain by glacial till and bedrock. The fill materials were generally identified to consist of varying percentages of sand, coal, ash, slag, and former building/structure debris. The thickness of these fill materials has been observed to range from approximately 1 to 2 feet in the northwestern portion of the Site to over 20 feet in the southern portion. The elevation of the top of the glacial till is inferred to generally slope downward from west to east across the Site as the estuarine and outwash deposits thicken proximate to the river. Along the river, the top of the glacial till was encountered at approximate elevations -16 feet (NAVD88) in the northern portion of the FGPA to approximate elevation -70 feet (NAVD88) in the SFA.

Groundwater on the Site is tidally-influenced and has been observed to fluctuate approximately 5 feet between mean low and high water in shallow monitoring wells adjacent to the Seekonk River. Groundwater was encountered at elevations ranging from approximately 26 feet (NAVD88) in the northwestern portion of the Site to approximately -1 feet (NAVD88) proximate to the Seekonk River. In general, groundwater is encountered within the fill materials across the FPPA and SFA where the fill thicknesses are more significant and within the underlying native materials in the FGPA and NFA.

#### **4.0 SUMMARY OF ENVIRONMENTAL IMPACTS**

Based on the type of chemical constituents present at the Site, the potential routes of exposure to excavation and/or utility workers include inhalation, dermal contact or accidental ingestion of impacted soil, and the possible introduction of contaminants through broken skin. Utilization of the appropriate personal protective equipment and the general safety guidelines provided herein will serve to minimize the potential for worker exposure to impacted media while performing work at the Site.

The following sections present a summary of soil and groundwater quality at the Site. For further detail, please refer to the January 2011 *Site Investigation Data Report*, on file with RIDEM.

In planning activities that may include disturbance of impacted materials, a qualified Environmental Professional shall review this environmental data and develop appropriate procedures for impacted soil disturbance/management/disposal and worker health and safety consistent with this SMP.

##### **4.1 CONSTITUENTS OF CONCERN**

Based on the results of the previous investigations described in the above reports, certain constituents of concern (COCs) were detected in soil and groundwater associated with former operations on the Site. A list of detected COCs and their concentration ranges are provided in the following tables. For comparative purposes, these tables also include the Industrial/Commercial Direct Exposure Criteria, the GB Leachability Criteria, the Upper Concentration Limit (UCL) and the GB Groundwater Objective within RIDEM's Remediation Regulations.

All results are reported in mg/L.

Non-aqueous phase liquid (NAPL) impacts have also been detected predominantly in the eastern portion of the Site proximate to and downgradient of the former MGP structures and petroleum storage tanks in the FPPA. The following table summarizes the ranges of NAPL thicknesses observed. Please refer to the historic reports for more detail on observed NAPL distribution and thicknesses.

	RANGE OF NAPL THICKNESSES OBSERVED (feet)
Light Non-Aqueous Phase Liquids (LNAPLs)	Trace (less than 0.01 feet) to 5.57 feet
Dense Non-Aqueous Phase Liquids (DNAPLs)	Trace (less than 0.01 feet) to 14.52 feet

## 5.0 SOIL AND GROUNDWATER MANAGEMENT REQUIREMENTS

The following management guidelines were developed for activities involving excavation/disturbance of impacted soils and/or groundwater located beneath the engineered caps and within areas along the western and southern Site boundaries which are

controlled via the engineered control fencing. As described in the ELUR and shown on the attached Figure 1, the “engineered controls” for the Site are defined as follows:

- The engineered cap in the paved portions of the Site consists of a minimum 2-inch layer of top course and a minimum 2-inch layer of binder course installed directly over the existing asphalt surface. These paved capped areas are limited to the area to the west and north of the Pawtucket No. 1 substation building;
- In the northern portion of the Site, the engineered cap consists of a permeable cap with a minimum 6-inch layer of topsoil underlain by a minimum 6-inch layer of compacted granular fill underlain by a geotextile fabric that acts as a warning barrier;
- An impermeable cap consisting of a minimum 6-inch layer of topsoil (northern portion) or 6-inch thick layer of gravel (southern portion) underlain by a minimum 18-inch layer of processed gravel, sand or other clean fill underlain by a liner system which includes a doubled-sided composite drainage net, a 40-mil HDPE liner, and an 8 oz non-woven geotextile;
- A crushed stone permeable cap consisting of a minimum 6-inch layer of crushed stone underlain by a minimum 6-inch layer of compacted granular fill underlain by a geotextile fabric that acts as a warning barrier to the east of the Pawtucket No. 1 substation building and the substation;
- Along portions of the riverfront, in the western portion of the NFA, and west of the natural gas regulating station, the engineered cap consists of a minimum 12-inch layer of RIDOT R-3 rip rap underlain by a geotextile fabric that acts as a warning barrier;
- The access road to the south of the substation and the staging area proximate to the transmission towers consists of a minimum 6-inch layer of compacted granular fill underlain by a minimum 18-inch layer of processed gravel, sand or clean fill underlain by a linear system which includes a doubled-sided composite drainage net, a 40-mil HDPE liner, and an 8 oz non-woven geotextile underlain by existing soil subgrade; and,
- Chain link fencing serves as an engineered control to restrict access to certain portions of the Site. The layout of this engineered control fencing is depicted on Figure 1.

These guidelines apply to all “non-emergency<sup>1</sup>” construction and utility maintenance and repair activities that disturb soils and/or groundwater beneath the engineered caps and within the areas restricted by the engineered control fencing. Soils generated from an excavation conducted at the Site may be placed back into its original excavation. However, so as to maintain known exposure scenarios, every attempt shall be made to backfill the excavation so that the corresponding depth and location of the backfilled soil resembles the depth and location at which the soil originally existed. This requirement includes the reinstallation of the geosynthetic barrier or impermeable liner and the re-placement of the engineered control cap. During re-placement of the engineered control cap, new sections of the geosynthetic barrier shall overlap the existing geosynthetic barrier by at least 2-feet and the edges of the new replacement impermeable liner shall be fusion-welded to the existing

---

<sup>1</sup> Refer to the “Emergency” provisions of the ELUR. In the event emergency work is necessary, this SMP shall be consulted and the provisions described herein will be followed to the extent practical.

liner to create an impermeable joint. Excess and/or materials deemed unsuitable for use as backfill shall be managed and disposed off-Site consistent with this SMP.

As previously described, groundwater was encountered at elevations ranging from approximately 26 feet (NAVD88) in the northwestern portion of the Site to approximately -1 feet (NAVD88) proximate to the Seekonk River. In addition, NAPL has been observed in certain limited areas of the Site (predominantly in the eastern portion of the Site proximate to and downgradient of the former MGP structures and petroleum storage tanks in the FPPA). Projects involving excavation below the water table and/or disturbance of impacted groundwater will require additional controls and Best Management Practices (BMPs) as described below.

#### *Non-Emergency Preliminary Activities*

- Prior to the initiation of soil excavation, the selected contractor or any other personnel performing subsurface work at the Site shall contact DIGSAFE® and appropriate utility companies to identify and mark the location of below grade utilities.
- Prior to performing the proposed work, the selected contractor and/or responsible party shall obtain all applicable federal, state and local permits. Please note, a portion of the Site is located within the jurisdictional limits of the Coastal Resource Management Council (CRMC). A jurisdictional determination of the requirements of the CRMC shall be made prior to the implementation of proposed construction projects. If applicable, CRMC approval shall be obtained prior to conducting the work.
- As described further herein, prior to conducting any earthwork/construction activities that involves disturbance of materials beneath the engineered caps or within the areas restricted by the engineered control fencing, a qualified Environmental Professional shall be consulted to determine the appropriate level of health and safety training required by personnel involved with the work, the personal protection equipment required, and general health and safety guidelines. A project specific Health and Safety Plan (HASp) shall be prepared by a qualified Certified Industrial Hygienist (CIH) and adhered to during all phases of the work.

#### *Soil and Groundwater Management Guidelines*

- A qualified Environmental Professional shall be on the Site during these activities to observe and document soil conditions, including field screening the soils via a handheld photoionization detector (PID).
- Reuse of excavate from below the engineered caps is allowable provided the material is placed below the same engineered cap type (e.g. impacted soil generated from below the impermeable engineered cap may be re-used as backfill below the impermeable engineered cap). To the extent practical, excavated materials shall be replaced such that

the corresponding depth and location of the backfilled soil resembles the depth and location at which the soil originally existed.

- Grossly impacted materials and/or materials deemed unsuitable for use as backfill shall be segregated and stockpiled separately for subsequent management and disposal.
- Stockpiled soils shall be staged and temporarily stored in a designated area of the Site for no more than 90 days. To the extent practical, the storage location shall be selected to limit unauthorized access to the materials (*i.e.*, away from public roadways/walkways).
- To limit the potential for run-off of soils from excavation areas, adequate erosion controls shall be established around the perimeter of the work area(s) and on the down slope side of disturbed areas susceptible to erosion. Erosion control devices such as staked haybales, silt fencing, and/or straw wattles shall be employed. All erosion controls shall be established and maintained as required by any applicable permits, including CRMC requirements.
- Excavated materials shall be temporarily placed in working stockpiles adjacent to excavations staged on two layers of 10-mil polyethylene sheeting to prevent potential re-contamination of the engineered caps. Depending on the volume of material involved in the project, soils shall be either stockpiled on polyethylene sheeting as described herein, or stored in lined roll-off type containers. NO excavated materials shall be placed directly on the ground surface. In selecting the soil storage location, considerations must be made relative to the requirements of CRMC. At the end of each work day all stockpiles shall be covered with 10-mil polyethylene sheeting to control the generation of wind-blown dusts and potential sediment migration. Stockpile areas shall be equipped with appropriate controls to limit the loss of the cover and protect against storm water erosion. This shall include the installation of hay bales, silt fencing and any other appropriate measures during the entire duration of the project. Stockpiles shall be inspected daily. Should tears or punctures be observed in either the polyethylene sheeting covering or underlying the piles, repairs shall be made immediately. Daily shutdown procedures shall include the covering and securing of all stockpiled material area with polyethylene sheeting.
- Best soil management practices shall be employed at all times and impacted soils shall be segregated into separate piles (or cells or containers) as appropriate.
- During earthwork, odors shall be monitored and controlled as necessary. Odor control measures shall be implemented as necessary, which shall include covering exposed excavated surfaces and stockpiles, limiting the extent of excavation at any one time, and the use of odor suppressing foams.
- During earthwork, dust suppression techniques shall be initiated and maintained at all times. All reasonable precautions shall be taken to prevent the excessive generation of

dust during soil excavation, stockpiling, loading, and other soil handling activities. Methods of stabilization consisting of sprinkling, mulching, or similar methods shall be employed as necessary for dust control. Dust controls shall be employed to ensure the work is conducted consistent with all applicable statutes, regulations, and ordinances. If excessive dust generation occurs and cannot be reasonably controlled, the job shall be shut down until dust control is achieved.

- In the event that unexpected observations or situations involving hazardous materials, hazardous wastes or similar conditions of environmental concern arise during work, earthwork activities shall be immediately ceased. Workers shall not attempt to handle the situation themselves but shall consult with the on-Site Environmental Professional for further evaluation and direction.
- Groundwater and/or NAPL generated during construction dewatering activities at the Site shall be managed, contained, treated (if necessary) and discharged, or disposed off-Site. All appropriate regulatory approvals related to the removal, handling, treatment and discharge of impacted groundwater shall be in-place prior to the initiation of the work. **Impacted, untreated groundwater shall not be discharged directly to the ground surface, collection utilities, or neighboring water body.**
- As shown on the attached Figure 1, a network of groundwater monitoring and recovery wells exist on the Site. When executing work, care shall be exercised to ensure that this well network is protected and maintained. In the event a well is damaged it shall be repaired or replaced. In the event a damaged well requires abandonment, the well abandonment procedures described in Appendix 1 of RIDEM's *Rules and Regulations for Groundwater Quality* shall be adhered to. No monitoring or recovery wells shall be abandoned without prior RIDEM approval.
- As shown on the attached Figure 1, a containment wall exists on the Site. When executing work, care shall be exercised to ensure that this containment wall is protected and maintained. In the event, the wall is damaged it shall be repaired or replaced.

#### *Air Monitoring and Controls*

As described previously, a Site-specific *Air Quality Monitoring Plan* (AQMP) has been prepared for the Tidewater Site. The following presents a summary of this AQMP which shall be reviewed by a qualified Environmental Professional prior to performance of earth disturbing activities where the potential for volatilization exists. The air quality monitoring program consists of a two-tiered approach using real-time air monitoring (Tier I) and time integrated sampling using EPA approved sampling and analytical methods (Tier II).

## Tier I—Real Time Monitoring

Real time monitoring will involve the use of the following hand- held instrumentation or equipment substantially similar thereto.

- Portable Photoionization Detector (PID) – this instrument measures total volatile organic compound (TVOC) concentrations with a detection limit of 10 parts per billion (ppb). TVOC readings will be measured directly upwind and downwind of the work zones and Site perimeter. Perimeter locations will be selected based on wind direction and location of the nearest potential sensitive receptor.
- DustTrak Dust Meter – this instrument uses infrared electromagnetic radiation to sense airborne particles less than 10 microns in size. The detection limit for this instrument is 1 microgram per cubic meter ( $\mu\text{g}/\text{m}^3$ ). Similar to the PID, the readings from this hand-held instrument will be measured directly upwind and downwind of the work zones and Site perimeter. Perimeter locations will be selected based on wind direction and location of the nearest potential sensitive receptor.
- Photovac Voyager Gas Chromatograph (GC) Field Gas Meter—this instrument measures real time benzene concentrations with a detection limit for benzene of 10 ppb. The GC will be calibrated to a known concentration of benzene each day prior to monitoring activities. Similar to the PID and DustTrak, the readings from this hand-held instrument will be measured directly upwind and downwind of the work zones and Site perimeter. Perimeter locations will be selected based on wind direction and location of the nearest potential sensitive receptor.

The use of hand held field equipment allows field personnel to alter monitoring locations based on the activity being performed and changing wind directions. The following table outlines the Action Levels for the Tier I monitoring program.

### Tier I Action Levels – Real Time Monitoring

Compound	Work Zone Perimeter	Site Line
TOTAL VOLATILE ORGANIC COMPOUNDS (TVOC)	1.0 PPM	0.5 PPM
RESPIRABLE PARTICULATE (PM10)	1,000 UG/M <sup>3</sup>	150 UG/M <sup>3</sup>
BENZENE	NOT APPLICABLE	0.35 PPM

In the event these real time action levels are exceeded, the likely cause will be identified and appropriate engineering controls and/or modification of work practices implemented. In addition, on any day when the real time monitoring exceeds these action levels, time integrated samples from upwind and downwind Site line locations will be sent to the laboratory for analysis (Tier II).

## Tier II—Time Integrated Sampling

Time integrated, laboratory samples will be collected at the nearest Site line directly downwind of the Work zone and at an upwind perimeter location. This second-tier monitoring program is designed to assess and document perimeter air quality during these activities. Samples will be collected daily during intrusive activities and submitted for analysis in the event of a Tier I Action Level exceedance. In addition, at least one set of time integrated samples will be analyzed during each work activity. At a minimum, two samples (one upwind and one downwind) will be collected each day using Summa canisters and high volume PUF samplers. In the event of Tier I Action Level exceedance, the Summa canisters will be analyzed for VOCs via USEPA Method TO-15 and the PUF samplers will be analyzed for naphthalene via USEPA Method TO-13. The following action levels were selected for use during the time integrated sample monitoring program.

### Tier II Action Levels – Time Integrated Samples (Site Line)

Compound	Wisconsin Action Level (24 hour average)	RIDEM AAL (24 hour)	Proposed Action Levels (24-hour average) <sup>2</sup>
BENZENE	10 PPB	6.2 PPB	6.2 PPB
TOLUENE	94 PPB	80 PPB <sup>3</sup>	80 PPB
ETHYLBENZENE	230 PPB	692 PPB	230 PPB
XYLENES	23 PPB	692 PPB	23 PPB
NAPHTHALENE	20 PPB	0.6 PPB <sup>4</sup>	20 PPB

These time integrated sampling results will be available 24 to 48 hours after collection. In the event time integrated perimeter sampling results indicate levels in excess of these action levels, work activities will be shutdown and engineered controls and work practices will be re-evaluated prior to restarting activities.

### *Waste Characterization and Disposal*

Soils excavated from the Site shall not be re-used at locations off-Site. All excess soils shall be transported to a facility licensed for recycling or disposal pre-approved by The Narragansett Electric Company. A qualified Environmental Professional shall collect samples of the excavated soils (either during excavation or from stockpiles) for laboratory testing. Soil must be sampled at a frequency adequate to support the data requirements of the selected disposal facility but should consider the following testing program.

<sup>2</sup> Action levels represent the lower of the DHFS and RIDEM AAL with the exception of naphthalene. DHFS action level for naphthalene is based on a subchronic exposure which is more appropriate for these shorter duration efforts than the AAL for naphthalene which is based on chronic exposure assumptions.

<sup>3</sup> RIDEM does not have a 24-hour AAL for toluene. This value based on RIDEM annual AAL for toluene.

<sup>4</sup> The listed 24 hour AAL for naphthalene is based on chronic exposure assumptions.

Analyte/Parameter	Test Method
Petroleum hydrocarbons	EPA Method 8100M
Volatile organic compounds	EPA Method 8260B
Semi-volatile organic compounds	EPA Method 8270
Total RCRA Metals	EPA Method 6010 & 7471A
Flashpoint	EPA Method 1010M
Corrosivity (pH)	EPA Method 9045C
Reactivity	EPA Methods SW-846 7.3.3.2/9014 and SW-846 7.3.4.2/376.2

- Copies of all profiles, manifests, bills of lading, and shipping paperwork shall be maintained by the Owner and included in a *Closure Report* or in the *Annual Inspection Report* prepared consistent with the requirements of Section H of the ELUR.

#### *Decontamination Protocols*

- At the conclusion of the construction activities or whenever heavy equipment or tools leave the Site, they shall be decontaminated as required by the qualified Environmental Professional within a pre-designated area. This area shall include adequate controls (e.g., decontamination pad or liner) to prevent the potential for impact to the surrounding ground surface. At a minimum, soil shall be brushed from the equipment and re-used as backfill or placed in stockpiles to be managed as described herein. Vehicles are not to leave the Site with visible soil residues on the exterior.
- All non-disposable equipment used during the soil disturbance activities shall be properly decontaminated as appropriate prior to removal from the Site. All disposable equipment used during the soil disturbance activities shall be properly containerized and disposed off Site following completion of the work.

#### *Restoration and Backfill*

- Site restoration activities shall, at a minimum, be performed such as to replace, to pre-construction conditions, the existing engineered controls. This includes replacement of the underlying geosynthetic fabric and/or liner. All disturbed areas shall be graded to match pre-existing conditions.
- Any clean fill material brought to the Site is required to meet the Department's Method 1 Residential Direct Exposure Criteria or be designated by a qualified Environmental Professional as Non-Jurisdictional under the Remediation Regulations. All clean fill, including sub-grade material and loam, imported to the Site must be sampled prior to delivery and placement. Laboratory analytical results shall be reviewed by a qualified Environmental Professional prior to acceptance or delivery to the Site. Clean fill and loam shall be sampled for arsenic, VOCs, total metals (RCRA 13), semi-volatile organic

compounds, and total petroleum hydrocarbons at a minimum frequency of one sample per 500 cubic yards. The *Annual Inspection Report* for the Site, or *Closure Report* if applicable, shall include the analytical sampling results from the imported materials demonstrating compliance. Any fill determined to be non-jurisdictional will also require the submission of a written certification by a qualified Environmental Professional designating that the fill is not jurisdictional.

## 6.0 HEALTH AND SAFETY REQUIREMENTS

The basic health and safety procedures outlined below shall be implemented while performing excavation work that includes disturbance of materials beneath the engineered controls at the Site. ***These health and safety procedures are intended as a general guideline only. Contractors and others involved in subsurface excavation work at the Site are responsible for the preparation of their own health and safety procedures and the protection of their own workers. Prior to conducting any earthwork/construction activities that involves disturbance of materials beneath the engineered controls, an Environmental Professional shall be consulted to determine the appropriate level of health and safety training required by personnel involved with the work.***

### *Personal Protective Equipment (PPE)*

In general, the level of protection which shall be used by workers will be determined by the task which the person is performing; however, at a minimum, Level D PPE shall be worn at all times while performing excavation activities within the ELUR area. Level D PPE shall, at a minimum, consist of the following:

- Steel-toe work boots with over-boots as needed;
- Hard hats;
- Safety vest;
- Safety glasses; and
- Rubber or leather gloves.

### *Operating Procedures/Safety Guidelines*

Regardless of the level of PPE necessary to complete work, the following general health and safety guidelines shall be followed during the performance of any excavation activities conducted:

- The location of all utilities in the vicinity of the excavation shall be established prior to beginning work.
- During work, precautions shall be taken to restrict access to the work area to only personnel involved in the work activities. Under no circumstances should the general public be allowed access to the area.

- Practice contamination avoidance: never sit or kneel in an excavation; never lay equipment on the ground; avoid obvious sources of contamination; and avoid unnecessary contact with objects in an excavation.
- Be alert to any unusual changes in your physical condition; never ignore warning signs. Notify the responsible employee as to any changed conditions.
- All equipment used in an excavation shall be properly cleaned and maintained in good working order. Equipment shall be inspected for signs of defect and/or contamination before use.
- Eating, drinking, chewing gum, and smoking shall be prohibited in active excavation areas.
- During working hours, workers who stop to drink or eat should leave the active work area, remove PPE, and wash hands thoroughly with soap and water prior to eating or drinking.
- The discovery of any condition that would suggest the existence of a situation more hazardous than anticipated shall result in the evacuation of personnel from the excavation and the re-evaluation of the hazard and the level of protection.
- At the completion of work, workers shall wash their hands with soap and water before leaving the Site. All workers safety boots are recommended to be brushed with a stiff bristle brush or similar instrument (not by hand) to remove residual soil. Disposable PPE shall be disposed of according to applicable regulations.

*Emergency Phone Numbers*

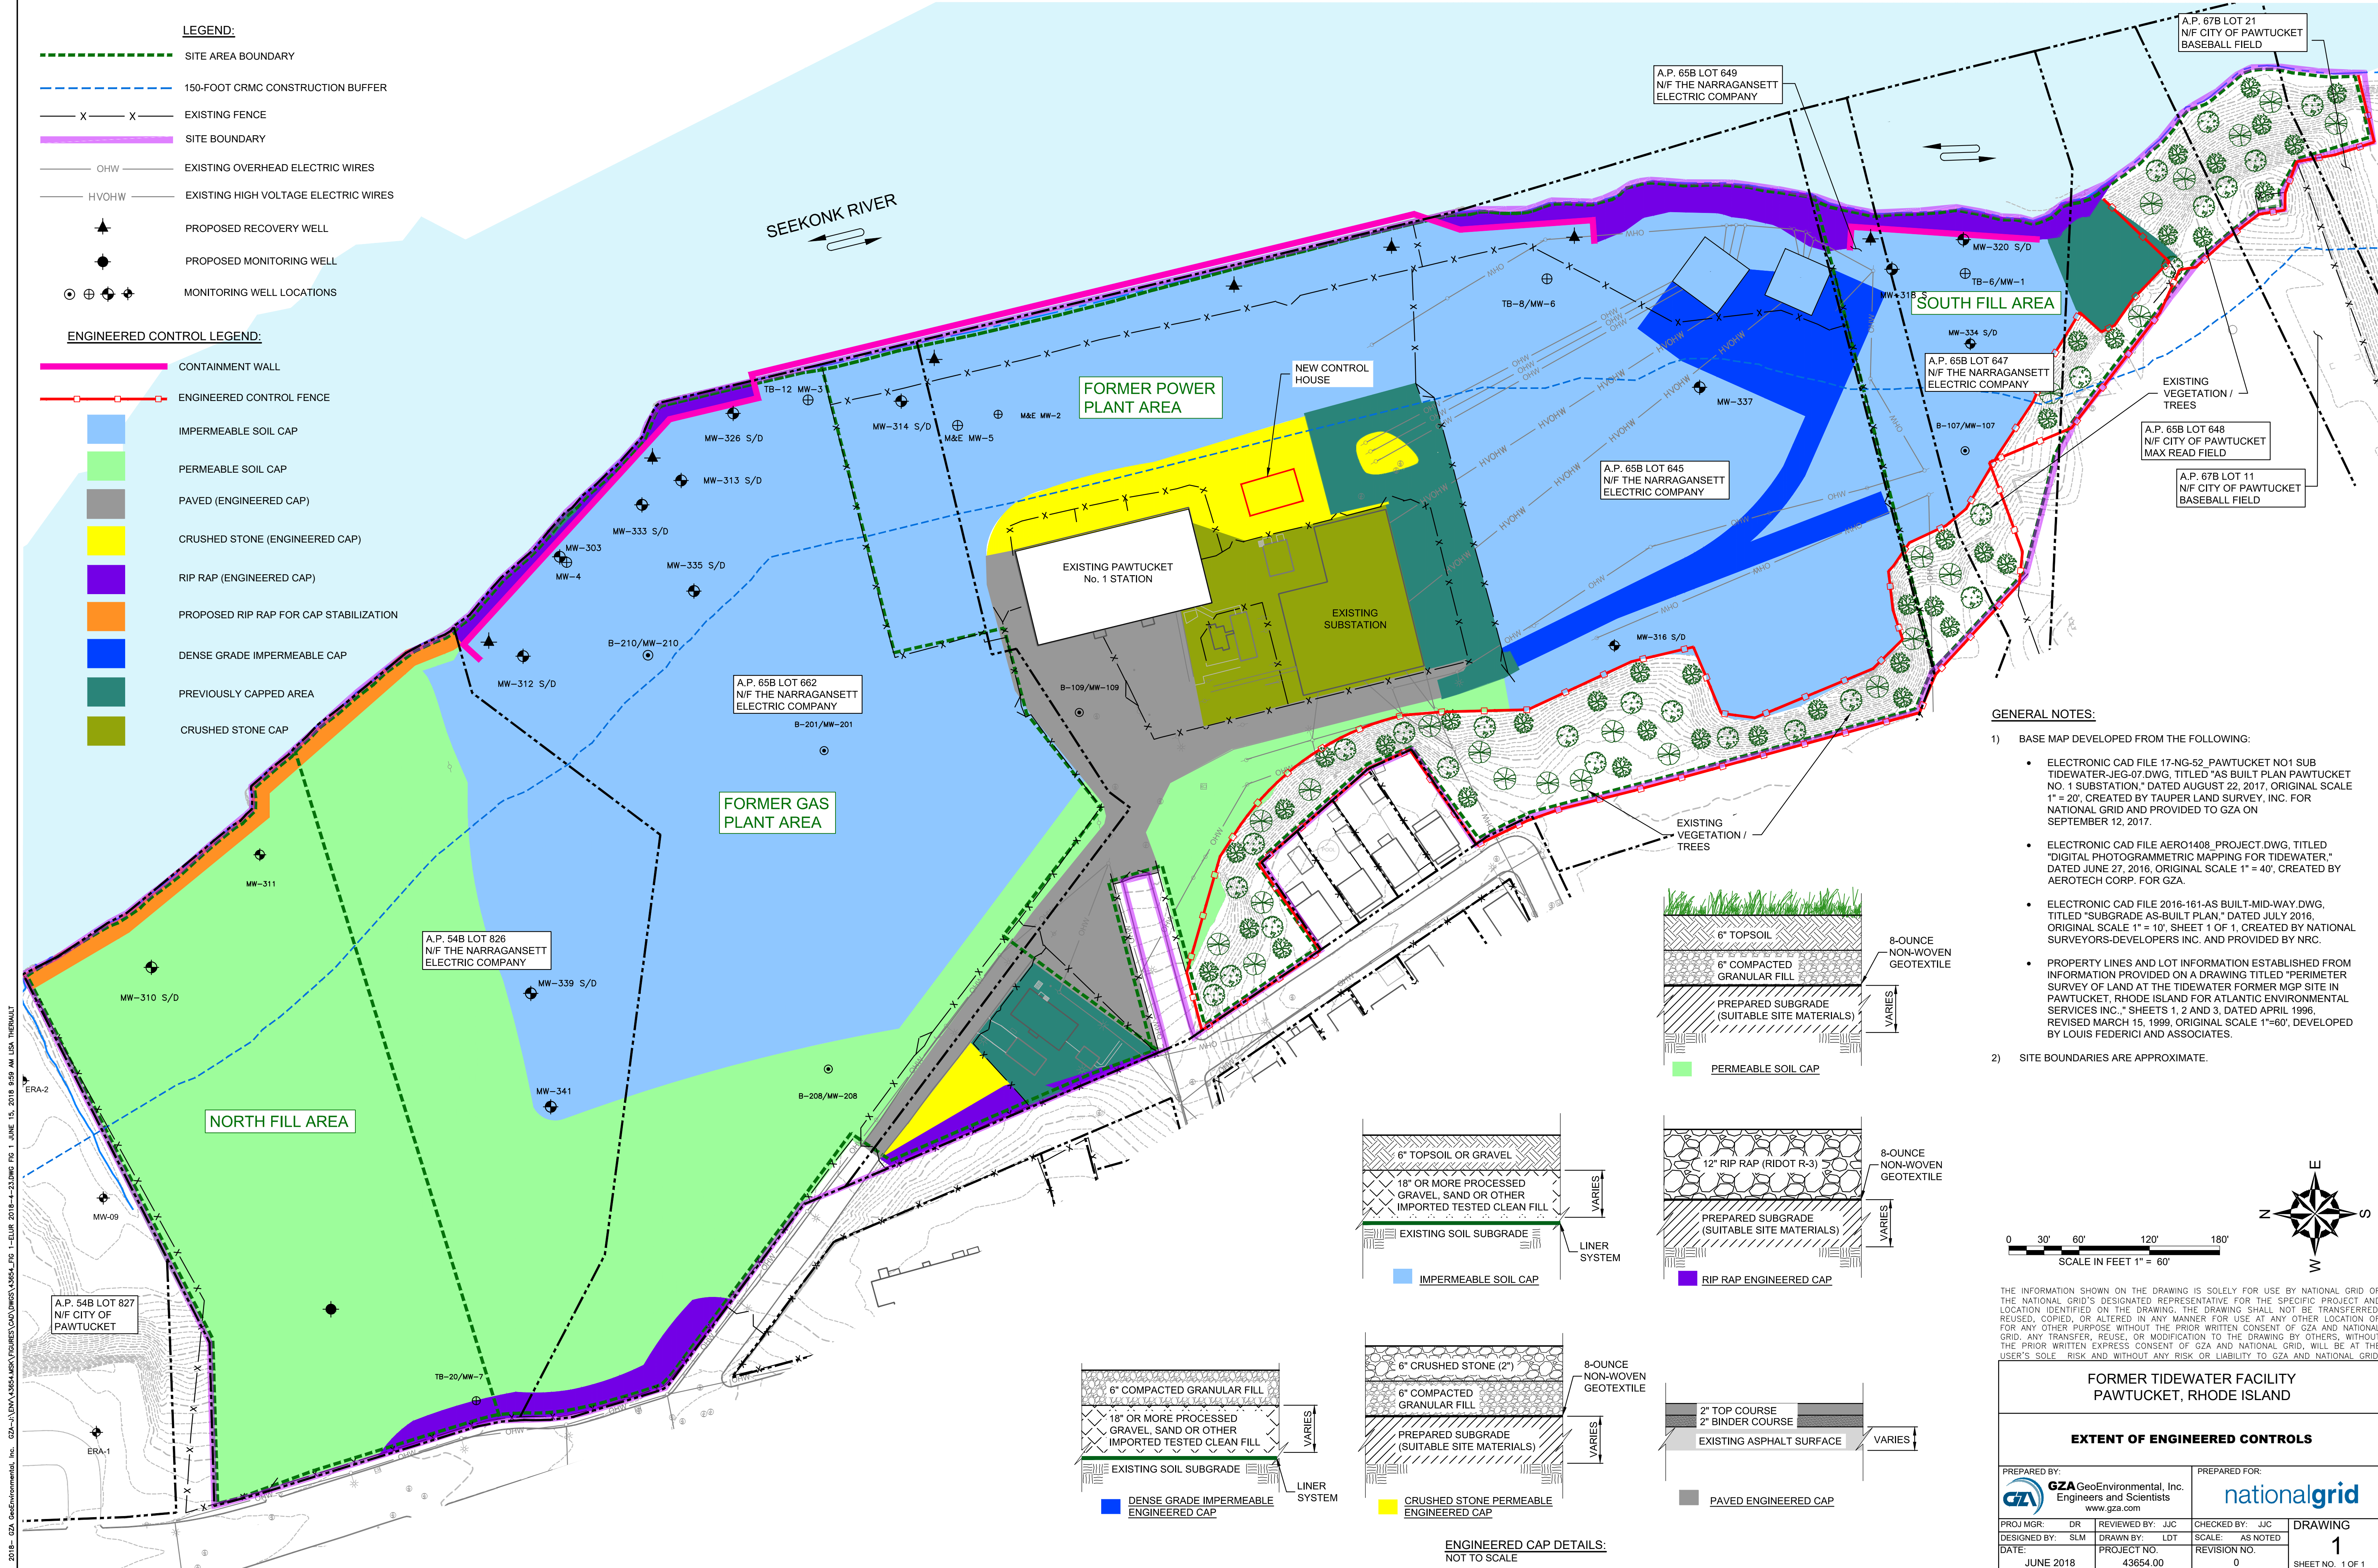

Emergency telephone numbers and the directions to the nearest hospital are included below. This information shall also be included in the Health and Safety Plans developed for the activity and shall be periodically reviewed and updated as needed.

<b>Response Agency</b>	<b>Phone Number</b>
Ambulance	911

## FINDING OF NO SIGNIFICANT IMPACT

September 12, 2017

Narragansett Electric Company d/b/a National Grid  
Att: William Howard  
280 Melrose Street  
Providence, RI 02907

RE: CRMC Assent No. A2017-09-027: perform test borings, test pits and surface soil sampling as per plans submitted to CRMC 9/11/2017. Project Location: 200 Taft Street, Pawtucket; Plat 54B|65|65B|67, Lot 826|645,654|662|11

Dear Applicant:

The Coastal Resources Management Council has reviewed your project proposal and has determined the findings of no significant impact on coastal resources. This project must be completed within three (3) years of the date of this notification, unless written application requesting an extension is received by CRMC sixty (60) days prior to the expiration date. If this project involves excess excavated materials, excess soils, excess construction materials, and debris (including any destructed materials) these materials shall be removed from the site and disposed of at an inland landfill or a suitable and legal upland location. **If the project involves earthwork, appropriate erosion controls shall be utilized.** All applicable policies, prohibitions, and standards of the RICRMP shall be upheld.

CAUTION: The limits of authorized work shall be only for that which was approved by the CRMC. Any activities or alterations in which deviate from this assent or what was detailed on the CRMC approved plans will require a separate application and review. Additionally, if the information provided to the CRMC for this review is inaccurate or did not reveal all necessary information or data, then this permit may be found to be null and void. Plans for any future alteration of the shoreline or construction or alteration within the 200' zone of CRMC jurisdiction or in coastal waters must be submitted for review to the CRMC prior to commencing such activity.

Permits, licenses or easements issued by the Council are valid only with the conditions and stipulation under which they are granted and imply no guarantee of renewal. The initial application or an application for renewal may be subject to denial or modification. If an application is granted, said permit, license and easement may be subject to revocation and/or modification for failure to comply with the conditions and stipulations under which the same was issued or for other good cause.

Applicant agrees that as a condition to the granting of this assent, members of the Coastal Resources Management Council or its staff shall have access to applicant's property to make on-site inspections to insure compliance with the assent.

A copy of this authorization to perform construction related activities shall be kept on site and available for inspection. NOTE: Failure to have this letter on site or work in excess of your proposal constitutes a violation under this program.

Sincerely,

William Mosunic, Administrative Officer  
Coastal Resources Management Council

## FINDING OF NO SIGNIFICANT IMPACT

September 28, 2017

City of Pawtucket  
137 Roosevelt Avenue  
Pawtucket, RI 02860

RE: CRMC Assent No. A2017-09-081: Perform surface soil sampling as per plans submitted to CRMC 9/28/17.  
Project Location: 486 Pleasant Street, Pawtucket; Plat 65, Lot 648

Dear Applicant:

The Coastal Resources Management Council has reviewed your project proposal and has determined the findings of no significant impact on coastal resources. This project must be completed within three (3) years of the date of this notification, unless written application requesting an extension is received by CRMC sixty (60) days prior to the expiration date. If this project involves excess excavated materials, excess soils, excess construction materials, and debris (including any destructed materials) these materials shall be removed from the site and disposed of at an inland landfill or a suitable and legal upland location. **If the project involves earthwork, appropriate erosion controls shall be utilized.** All applicable policies, prohibitions, and standards of the RICRMP shall be upheld.

**CAUTION:** The limits of authorized work shall be only for that which was approved by the CRMC. Any activities or alterations in which deviate from this assent or what was detailed on the CRMC approved plans will require a separate application and review. Additionally, if the information provided to the CRMC for this review is inaccurate or did not reveal all necessary information or data, then this permit may be found to be null and void. Plans for any future alteration of the shoreline or construction or alteration within the 200' zone of CRMC jurisdiction or in coastal waters must be submitted for review to the CRMC prior to commencing such activity.

Permits, licenses or easements issued by the Council are valid only with the conditions and stipulation under which they are granted and imply no guarantee of renewal. The initial application or an application for renewal may be subject to denial or modification. If an application is granted, said permit, license and easement may be subject to revocation and/or modification for failure to comply with the conditions and stipulations under which the same was issued or for other good cause.

Applicant agrees that as a condition to the granting of this assent, members of the Coastal Resources Management Council or its staff shall have access to applicant's property to make on-site inspections to insure compliance with the assent.

A copy of this authorization to perform construction related activities shall be kept on site and available for inspection. **NOTE:** Failure to have this letter on site or work in excess of your proposal constitutes a violation under this program.

Sincerely,

William Mosunic, Administrative Officer  
Coastal Resources Management Council

/bms

State of Rhode Island and Providence Plantations

COASTAL RESOURCES MANAGEMENT COUNCIL

NOTICE OF

ASSENT

CRMC Assent No.: A2017-09-081

Date: September 28, 2017

This certifies that City of Pawtucket

has permission to Perform surface soil sampling as per plans submitted to CRMC 9/28/17.

situated at 486 Pleasant Street

Plat No. 65

Lot No. 648

Said construction operations to be done in accordance with an approved assent on file in the Offices of the Coastal Resources Management Council and subject further to all the provisions of the building ordinances of the :

City/Town of

Pawtucket

and to all the applicable State, Local and Federal provisions. This assent shall expire three (3) years from the date of this assent.

*William J. Scelzo*

Official Designee

Coastal Resources Management Council

**THIS CARD MUST BE DISPLAYED IN A CONSPICUOUS PLACE ON THE PREMISES. FAILURE TO DISPLAY WILL RESULT IN LEGAL ACTION.**

- Imported fill over geotextile fabric from previous construction project at 0 to 1.5 feet below ground surface in southern portion of test pit only.
- Other debris observed including Tyvek suits and rubber tire.
- Soils backfilled in the general order they were excavated. Backfilled soil was compacted via excavator bucket tamping every 12 inch lift.

-13-					
-14-					

**REMARKS:**

1. Soil samples screened with a MiniRAE 3000 photoionization detector (PID). PID values represent meter response in parts per million (ppm) relative to benzene in air and above background readings. ND = None Detected above background.
2. 1-foot of imported fill over geotextile fabric at 0 to 1 foot below ground surface from previous construction project.
3. Moderate to heavy groundwater weeping at approximately 6 feet below ground surface.
4. 4-inch diameter iron pipe observed at approximately 2.5 to 3 feet below ground surface running north-south.
5. Soils backfilled in the general order they were excavated. Backfilled soil was compacted via excavator bucket tamping every 12 inch lift.

**REMARKS:**

- Soil samples screened with a MiniRAE 3000 photoionization detector (PID). PID values represent meter response in parts per million (ppm) relative to benzene in air and above background readings. ND = None Detected above background.
- Raceway depth measured through board crack to approximately 6 inches.
- Soils backfilled in the general order they were excavated. Backfilled soil was compacted via excavator bucket tamping every 12 inch lift.

**REMARKS:**

- Soil samples screened with a MiniRAE 3000 photoionization detector (PID). PID values represent meter response in parts per million (ppm) relative to benzene in air and above background readings. ND = None Detected above background.
- Wood raceway observed at approximately 1.5 feet below ground surface. Location completed to trace raceway north in attempt to find the northern most extent of the raceway.
- Soils backfilled in the general order they were excavated. Backfilled soil was compacted via excavator bucket tamping every 12 inch lift.

-13-					
-14-					

**REMARKS:**

- Soil samples screened with a MiniRAE 3000 photoionization detector (PID). PID values represent meter response in parts per million (ppm) relative to benzene in air and above background readings. ND = None Detected above background.
- On 12/28/17 excavated soils were visually assessed for the presence of blue staining, which would be indicative of purifier waste. No blue staining was observed.
- Soils backfilled in general order they were excavated. Backfilled soil was compacted via excavator bucket tamping every 12" lift.

**REMARKS**

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

**REMARKS**

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

**REMARKS**

1 - Soil samples screened with a 10.6 eV MiniRAE 2000 photoionization detector (PID). PID values represent meter response in parts per million (ppm) relative to benzene in air and above background readings. ND=None Detected above background.  
2 - Borehole backfilled with a portland cement and bentonite grout via tremmie pipe.  
3 - Three locations encountered refusal at 3' bgs due to concrete.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

**REMARKS**

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

**REMARKS**  
 1 - Soil samples screened with a 10.6 eV MiniRAE 2000 photoionization detector (PID). PID values represent meter response in parts per million (ppm) relative to benzene in air and above background readings. ND=None Detected above background.  
 2 - Borehole backfilled with a portland cement and bentonite grout via tremmie pipe.  
 3 - Very loose material.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

**REMARKS**  
 1 - Soil samples screened with a 10.6 eV MiniRAE 2000 photoionization detector (PID). PID values represent meter response in parts per million (ppm) relative to benzene in air and above background readings. ND=None Detected above background.  
 2 - Borehole backfilled with a portland cement and bentonite grout via tremmie pipe.  
 3 - Drill chatter from 26-30 feet.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

**REMARKS**  
3 - 40 to 41 feet sample likely to be slough.  
4 - 60 to 61.7 fete very loose soils.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

**REMARKS**

1 - Soil samples screened with a 10.6 eV MiniRAE 2000 photoionization detector (PID). PID values represent meter response in parts per million (ppm) relative to benzene in air and above background readings. A "\*" indicates a sample sent to a laboratory for additional analyses or screening. ND=None Detected above background.  
 2 - Borehole backfilled with a portland cement and bentonite grout via tremmie pipe.  
 3 - Sheen in water when drilling out casing from 5-7'. 4. - Drill rig chatter from 7-7.5'.  
 5 - Drill rig chatter from 9.5-13.92', likely boulder. 6. - Drill chatter @ 27'. 7. - NAPL observed in drill water starting at 28.5'.  
 8 - Unable to collect 30-32' sample due to possible breaking of casing @ 25'. Difficult drilling and drilling chatter indicate possible Glacial Till at 29'.

See Log Key for exploration of sample description and identification procedures. Stratification lines represent approximate boundaries between soil and bedrock types. Actual transitions may be gradual. Water level readings have been made at the times and under the conditions stated. Fluctuations of groundwater may occur due to other factors than those present at the times the measurements were made.

## **APPENDIX E**

### **LDI LABORATORY RESULTS**

## CERTIFICATE OF ANALYSIS

Sarah McLeod  
GZA GeoEnvironmental, Inc.  
530 Broadway  
Providence, RI 02909

**RE: Former Tidwater Facility (05.0043654.00)**  
**ESS Laboratory Work Order Number: 1709470**

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard  
Laboratory Director

**REVIEWED**

**By ESS Laboratory at 3:44 pm, Sep 26, 2017**

### Analytical Summary

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

*CERTIFICATE OF ANALYSIS*

Client Name: GZA GeoEnvironmental, Inc.  
Client Project ID: Former Tidwater Facility

ESS Laboratory Work Order: 1709470

**SAMPLE RECEIPT**

The following samples were received on September 15, 2017 for the analyses specified on the enclosed Chain of Custody Record.

**Low Level VOA vials were frozen by ESS Laboratory on September 15, 2017 at 22:40.**

<u>Lab Number</u>	<u>Sample Name</u>	<u>Matrix</u>	<u>Analysis</u>
1709470-01	TP-501 (0-1.5')	Soil	6010C, 6020A, 7471B, 8100M, 8260B Low, 8270D, 9014
1709470-02	TP-501 (3.5-4')	Soil	6010C, 6020A, 7471B, 8100M, 8260B Low, 8270D, 9014
1709470-03	TP-502 (0-1')	Soil	6010C, 6020A, 7471B, 8100M, 8260B Low, 8270D, 9014

**CURRENT SW-846 METHODOLOGY VERSIONS**

**Analytical Methods**

- 1010A - Flashpoint
- 6010C - ICP
- 6020A - ICP MS
- 7010 - Graphite Furnace
- 7196A - Hexavalent Chromium
- 7470A - Aqueous Mercury
- 7471B - Solid Mercury
- 8011 - EDB/DBCP/TCP
- 8015C - GRO/DRO
- 8081B - Pesticides
- 8082A - PCB
- 8100M - TPH
- 8151A - Herbicides
- 8260B - VOA
- 8270D - SVOA
- 8270D SIM - SVOA Low Level
- 9014 - Cyanide
- 9038 - Sulfate
- 9040C - Aqueous pH
- 9045D - Solid pH (Corrosivity)
- 9050A - Specific Conductance
- 9056A - Anions (IC)
- 9060A - TOC
- 9095B - Paint Filter
- MADEP 04-1.1 - EPH / VPH

**Prep Methods**

- 3005A - Aqueous ICP Digestion
- 3020A - Aqueous Graphite Furnace / ICP MS Digestion
- 3050B - Solid ICP / Graphite Furnace / ICP MS Digestion
- 3060A - Solid Hexavalent Chromium Digestion
- 3510C - Separatory Funnel Extraction
- 3520C - Liquid / Liquid Extraction
- 3540C - Manual Soxhlet Extraction
- 3541 - Automated Soxhlet Extraction
- 3546 - Microwave Extraction
- 3580A - Waste Dilution
- 5030B - Aqueous Purge and Trap
- 5030C - Aqueous Purge and Trap
- 5035 - Solid Purge and Trap

SW846 Reactivity Methods 7.3.3.2 (Reactive Cyanide) and 7.3.4.1 (Reactive Sulfide) have been withdrawn by EPA. These methods are reported per client request and are not NELAP accredited.

**Notes and Definitions**

- U Analyte included in the analysis, but not detected
- IC Internal Standard(s) outside of criteria. Sample was reanalyzed to confirm (IC).
- D Diluted.
- B- Blank Spike recovery is below lower control limit (B-).
- ND Analyte NOT DETECTED at or above the MRL (LOQ), LOD for DoD Reports, MDL for J-Flagged Analytes
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference
- MDL Method Detection Limit
- MRL Method Reporting Limit
- LOD Limit of Detection
- LOQ Limit of Quantitation
- DL Detection Limit
- I/V Initial Volume
- F/V Final Volume
- § Subcontracted analysis; see attached report
- 1 Range result excludes concentrations of surrogates and/or internal standards eluting in that range.
- 2 Range result excludes concentrations of target analytes eluting in that range.
- 3 Range result excludes the concentration of the C9-C10 aromatic range.
- Avg Results reported as a mathematical average.
- NR No Recovery
- [CALC] Calculated Analyte
- SUB Subcontracted analysis; see attached report
- RL Reporting Limit
- EDL Estimated Detection Limit

## ESS Laboratory Sample and Cooler Receipt Checklist

Client: GZA - Providence, RI - GZA/HDM

ESS Project ID: 1709470

Date Received: 9/15/2017

Shipped/Delivered Via: ESS Courier

Project Due Date: 9/22/2017

Days for Project: 5 Day

1. Air bill manifest present?  No  
Air No.: NA

6. Does COC match bottles?  Yes

2. Were custody seals present?  No

7. Is COC complete and correct?  Yes

3. Is radiation count <100 CPM?  Yes

8. Were samples received intact?  Yes

4. Is a Cooler Present?  Yes  
Temp: 3.5 Iced with: Ice

9. Were labs informed about **short holds & rushes**? Yes / No /  NA

5. Was COC signed and dated by client?  Yes

10. Were any analyses received outside of hold time? Yes  No

11. Any Subcontracting needed? Yes  No  
ESS Sample IDs: \_\_\_\_\_  
Analysis: \_\_\_\_\_  
TAT: \_\_\_\_\_

12. Were VOAs received?  Yes / No  
a. Air bubbles in aqueous VOAs?  Yes / No  
b. Does methanol cover soil completely?  Yes / No / NA

13. Are the samples properly preserved?  Yes / No  
a. If metals preserved upon receipt: Date: 9/15/17  
b. Low Level VOA vials frozen: Date: 9/15/17

Time: 2240 By: RE

Sample Receiving Notes:

14. Was there a need to contact Project Manager?  Yes / No  
a. Was there a need to contact the client?  Yes / No  
Who was contacted? \_\_\_\_\_ Date: \_\_\_\_\_ Time: \_\_\_\_\_ By: \_\_\_\_\_

## CERTIFICATE OF ANALYSIS

Sarah McLeod  
GZA GeoEnvironmental, Inc.  
530 Broadway  
Providence, RI 02909

**RE: Former Tidwater Facility (05.0043654.00)**  
**ESS Laboratory Work Order Number: 1709493**

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard  
Laboratory Director

**REVIEWED**

*By ESS Laboratory at 5:11 pm, Sep 27, 2017*

**Analytical Summary**

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

*CERTIFICATE OF ANALYSIS*

## CERTIFICATE OF ANALYSIS

Client Name: GZA GeoEnvironmental, Inc.

Client Project ID: Former Tidwater Facility

ESS Laboratory Work Order: 1709493

### Notes and Definitions

- U Analyte included in the analysis, but not detected
- D+ Relative percent difference for duplicate is outside of criteria (D+).
- D Diluted.
- B+ Blank Spike recovery is above upper control limit (B+).
- B- Blank Spike recovery is below lower control limit (B-).
- ND Analyte NOT DETECTED at or above the MRL (LOQ), LOD for DoD Reports, MDL for J-Flagged Analytes
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference
- MDL Method Detection Limit
- MRL Method Reporting Limit
- LOD Limit of Detection
- LOQ Limit of Quantitation
- DL Detection Limit
- I/V Initial Volume
- F/V Final Volume
- § Subcontracted analysis; see attached report
- 1 Range result excludes concentrations of surrogates and/or internal standards eluting in that range.
- 2 Range result excludes concentrations of target analytes eluting in that range.
- 3 Range result excludes the concentration of the C9-C10 aromatic range.
- Avg Results reported as a mathematical average.
- NR No Recovery
- [CALC] Calculated Analyte
- SUB Subcontracted analysis; see attached report
- RL Reporting Limit
- EDL Estimated Detection Limit

## ESS Laboratory Sample and Cooler Receipt Checklist

Client: GZA - Providence, RI - GZA/HDM

ESS Project ID: 1709493

Shipped/Delivered Via: Client

Date Received: 9/18/2017

Project Due Date: 9/25/2017

Days for Project: 5 Day

1. Air bill manifest present?  No

Air No.: NA

6. Does COC match bottles?  No

2. Were custody seals present?  No

7. Is COC complete and correct?  Yes

3. Is radiation count <100 CPM?  Yes

8. Were samples received intact?  Yes

4. Is a Cooler Present?  Yes

Temp: 5.2 Iced with: Ice

9. Were labs informed about **short holds & rushes**? Yes / No / NA

5. Was COC signed and dated by client?  Yes

10. Were any analyses received outside of hold time? Yes / No

11. Any Subcontracting needed? Yes  No

ESS Sample IDs:

Analysis: \_\_\_\_\_

TAT: \_\_\_\_\_

12. Were VOAs received?  Yes / No

a. Air bubbles in aqueous VOAs? Yes / No

b. Does methanol cover soil completely? Yes / No / NA

13. Are the samples properly preserved?  Yes / No

a. If metals preserved upon receipt:

Date: \_\_\_\_\_

Time: \_\_\_\_\_

By: \_\_\_\_\_

b. Low Level VOA vials frozen:

Date: 9/18/17

Time: 1724

By: AL

Sample Receiving Notes:

Did not receive soil jar for TP-509(0-2'), Rec'd 1vial MeOH, 2vials DI water and amber soil jar labeled TP-508(0-2') and 1vial MeOH, 2vials DI water

and amber soil jar labeled TP-508(4-5') not listed on COC 9/18/17 *Added temp blank as stated 9/18/17*

14. Was there a need to contact Project Manager?  Yes / No

a. Was there a need to contact the client?  Yes / No

Who was contacted? \_\_\_\_\_

Date: \_\_\_\_\_

Time: \_\_\_\_\_

## CERTIFICATE OF ANALYSIS

Sarah McLeod  
GZA GeoEnvironmental, Inc.  
530 Broadway  
Providence, RI 02909

**RE: Former Tidwater Facility (05.0043654.00)**  
**ESS Laboratory Work Order Number: 1709662**

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard  
Laboratory Director

**REVIEWED***By ESS Laboratory at 5:47 pm, Sep 29, 2017***Analytical Summary**

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

## CERTIFICATE OF ANALYSIS

Client Name: GZA GeoEnvironmental, Inc.

Client Project ID: Former Tidwater Facility

ESS Laboratory Work Order: 1709662

### Notes and Definitions

- U Analyte included in the analysis, but not detected
- R- Standard Reference Material is biased low (R-).
- D Diluted.
- B- Blank Spike recovery is below lower control limit (B-).
- ND Analyte NOT DETECTED at or above the MRL (LOQ), LOD for DoD Reports, MDL for J-Flagged Analytes
- dry Sample results reported on a dry weight basis
- RPD Relative Percent Difference
- MDL Method Detection Limit
- MRL Method Reporting Limit
- LOD Limit of Detection
- LOQ Limit of Quantitation
- DL Detection Limit
- I/V Initial Volume
- F/V Final Volume
- § Subcontracted analysis; see attached report
- 1 Range result excludes concentrations of surrogates and/or internal standards eluting in that range.
- 2 Range result excludes concentrations of target analytes eluting in that range.
- 3 Range result excludes the concentration of the C9-C10 aromatic range.
- Avg Results reported as a mathematical average.
- NR No Recovery
- [CALC] Calculated Analyte
- SUB Subcontracted analysis; see attached report
- RL Reporting Limit
- EDL Estimated Detection Limit

## CERTIFICATE OF ANALYSIS

Sarah McLeod  
GZA GeoEnvironmental, Inc.  
530 Broadway  
Providence, RI 02909

**RE: Former Tidewater Facility (05.0043654.00)**  
**ESS Laboratory Work Order Number: 1709754**

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard  
Laboratory Director

**REVIEWED**

By ESS Laboratory at 2:32 pm, Oct 05, 2017

**Analytical Summary**

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

<u>Analyte</u>	<u>Results (MRL)</u>	<u>MDL</u>	<u>Method</u>	<u>Limit</u>	<u>DF</u>	<u>Analyzed</u>	<u>Sequence</u>	<u>Batch</u>
Bromochloromethane	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Bromodichloromethane	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Bromoform	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Bromomethane	ND (0.0110)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Carbon Disulfide	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Carbon Tetrachloride	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Chlorobenzene	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Chloroethane	ND (0.0110)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Chloroform	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Chloromethane	ND (0.0110)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
cis-1,2-Dichloroethene	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
cis-1,3-Dichloropropene	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Dibromochloromethane	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Dibromomethane	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Dichlorodifluoromethane	ND (0.0110)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Diethyl Ether	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Di-isopropyl ether	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Ethyl tertiary-butyl ether	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Ethylbenzene	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Hexachlorobutadiene	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Isopropylbenzene	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Methyl tert-Butyl Ether	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Methylene Chloride	ND (0.0274)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Naphthalene	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
n-Butylbenzene	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
n-Propylbenzene	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
sec-Butylbenzene	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
<b>Styrene</b>	<b>0.0059</b> (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
tert-Butylbenzene	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Tertiary-amyl methyl ether	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Tetrachloroethene	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730
Tetrahydrofuran	ND (0.0055)		8260B Low		1	09/27/17 22:03	C7I0440	CI72730

Client Name: GZA GeoEnvironmental, Inc.  
 Client Project ID: Former Tidewater Facility  
 Client Sample ID: GZ-SS-531 (0-2')  
 Date Sampled: 09/26/17 13:55  
 Percent Solids: 95  
 Initial Volume: 4.8  
 Final Volume: 10  
 Extraction Method: 5035

ESS Laboratory Work Order: 1709754  
 ESS Laboratory Sample ID: 1709754-15  
 Sample Matrix: Soil  
 Units: mg/kg dry  
 Analyst: MEK
