## HISTORY OF RHODE ISLAND'S DAM SAFETY PROGRAM

The Rhode Island dam inspection and inventory program had its inception in 1883, and was under the authority and responsibility of the Commissioner of Dams and Reservoirs. At that time, there were 86 dams included in the inventory records; today, there are 528 inventoried dams.

### DAM CLASSIFICATIONS

All of the inventoried dams are classified by size and hazard ratings. The size classification provides a relative description of small, medium or large, based on the storage capacity and height of the impounded water. The hazard classification relates to the potential for harm due to failure or misoperation of the dam; it does not relate to the current condition of the dam. The hazard classifications are defined as follows:

High Hazard – means a dam where failure or misoperation will result in a probable loss of human life.

Significant Hazard – means a dam where failure or misoperation results in no probable loss of human life but can cause major economic loss, disruption of lifeline facilities or impact other concerns detrimental to the public's health, safety or welfare.

Low Hazard – means a dam where failure or misoperation results in no probable loss of human life and low economic losses.

There are 17 high hazard dams, 41 significant hazard dams and 505 low hazard dams. The following chart illustrates the number of dams in each classification and a list of all the inventoried dams, sorted by town and river, is attached.

**Hazard Classifications**  
(Percent of Inventoried Dams)

Most of these hazard classifications were assigned in the late 1970's and early 1980's. However, due to additional development throughout the state in those areas downstream of dams, many of the classifications are no longer accurate. As indicated in the "Grants" section of this report, the Department

of Environmental Management (DEM) is continuing to utilize Federal Emergency Management Agency (FEMA) grants to obtain engineering services to update the hazard classifications.

### STATUTES

As set forth in Rhode Island General Laws, Chapters 46-18 and 46-19, a dam owner has the responsibility for the safe operation of his/her dam, and is liable for the consequences of accidents or failures of the dam. In general, a dam owner is required to use “*reasonable care*” in the operation and maintenance of a dam. This responsibility includes the proper operation, maintenance, repair and rehabilitation of a dam, which are essential elements in preventing a dam failure.

The criteria governing the administration and enforcement of Rhode Island’s Dam Safety Program are contained in the General Laws of Rhode Island, Chapter 46-19. DEM has the responsibility to cause to be inspected dams to determine their condition, to review and approve plans for construction or substantial alteration of a dam and to order the owner to make repairs or to take other necessary action to make the dam safe.

### GOVERNOR’S TASK FORCE ON DAM SAFETY AND MAINTENANCE

In May 2000, Governor Almond issued Executive Order 00-6, *Creation of Dam Safety and Maintenance Task Force*. The Task Force was charged with developing recommendations for a comprehensive program of monitoring, maintenance and repairs that will enhance upkeep and safety of the dams in the State.

The Task Force, co-chaired by the Directors of DEM and of the RI Emergency Management Agency (RIEMA), was comprised of representatives of the RI Budget Office, the RI Clean Water Finance Agency, the Natural Resources Conservation Service, Public Works Directors for three Rhode Island municipalities, five dam associations, two dam owners, and four members of the General Assembly (not all General Assembly members were officially appointed to the Task Force).

The Task Force convened for 12 two hour sessions over a six month period, and finalized their recommendations in a report dated January 2001. The recommendations included legislative, regulatory, administrative and policy proposals designed to protect public safety, create an efficient approach to dam repairs and ensure a timely response should a community be threatened by a dam failure.

Although the proposed legislation developed by the Task Force was not enacted, DEM has identified a number of recommendations that can be implemented by regulations. In 2002, DEM began drafting regulations to incorporate those Task Force’s recommendations that can be implemented within the framework of the existing statute. In 2003, the draft regulations were about 90% complete. In conjunction with draft Dam Safety Regulations, DEM has been drafting amendments to the Freshwater Wetlands Regulations to streamline approvals for dam repair.

As explained in the “*Statewide Inventory and Inspection Project*” section of this report, DEM is continuing to update the hazard classifications for all dams. We anticipate completing the hazard classifications in 2004, and at that point initiating promulgation of the Dam Safety Regulations.

### **PROFESSIONAL ASSOCIATIONS**

Rhode Island has been a member of the Association of State Dam Safety Officials (ASDSO) since its inception in Denver, Colorado in 1984. ASDSO membership consists of state representatives along with corporate and individual members representing dam owners and professional engineering firms. ASDSO was formed to serve these initial functions:

- Improve efficiency and effectiveness of state dam safety programs;
- Foster public awareness;
- Facilitate inter-organizational, intergovernmental and interstate cooperation;
- Assist the dam safety community and provide a forum for the exchange of information;

- Provide representation of dam safety interests before state legislatures and before Congress; and
- Manage the association effectively through internal policies and procedures.

ASDSO has helped to improve dam safety in Rhode Island mainly through its sponsorship of regional dam safety workshops and its national annual conferences. In addition, various grants have provided funds for the purchase of computers, camera and video equipment and various types of field equipment to aid in the inspection and inventory of dams. These grant programs have also been supported, in part, by FEMA.

**David King Farm Pond Dam (No. 594), Gloucester**

### **INSPECTION PROGRAM**

Each dam's hazard classification determines the frequency of inspection. The higher the classification, the more frequently the inspection is conducted. A dam of any classification is also inspected upon request by the owner, a town/city official, or a person owning or representing property liable to damage from the dam in the event of failure.

The inspections performed by DEM are visual inspections and are conducted under a general inspection format based on guidelines established in 1976 by the United States Army Corps of Engineers (ACOE) for the National Program for the Inspection of (Non-Federal) Dams.

As part of each visual inspection, the condition of the major components of the dam are subjectively rated as *good*, *fair* or *poor*. The major components of a dam are the embankment, the spillway and the low level outlet. *Good* is defined as meeting minimum guidelines, where no irregularities are observed and the component appears to be maintained properly. *Fair* indicates a component which requires maintenance that has not led to the need for structural repairs (e.g., missing mortar in a masonry wall that has not yet caused displacement of the masonry units). *Poor* indicates a component that has deteriorated beyond a maintenance issue and requires major repair; the component no longer functions as it was originally intended (e.g., an inoperable low level outlet, a permanently blocked outlet, or an earthen embankment with extensive, deep rooted vegetation). A component rated as poor typically requires an engineering evaluation and extensive work to return it to proper order.

Following a visual inspection, a dam inspection report is prepared, identifying specific deficiencies and, when warranted, recommending corrective measures. A copy of the report is forwarded to the owner, with the expectation that the deficiencies will be corrected. However, unless DEM has determined that a

dam is unsafe, DEM can only recommend corrective measures, rather than require them. If a dam is determined to be unsafe, then DEM may order corrective actions.

## ACTIVITIES IN 2003

### INSPECTIONS

#### Statewide Inventory and Inspection Project

In June 2003, the Dam Safety Program began a project to inventory all dams in the state. This includes an inspection of any dam not previously inventoried that, in the opinion of the Dam Safety Engineer, may pose a threat to public safety or property in the event of its failure or misoperation, and inspection of any inventoried dam that has not been inspected in the past five years. The project began in the northern part of the state and is proceeding geographically to the south. Information on the location (latitude, longitude and town) of the dam and its height and general condition are collected. The project was about 25% complete in 2003 and is intended to be completed in the fall of 2004.

Those dams for which the hazard classification is questionable will be forwarded to an engineering consultant for evaluation of the classification (see *GRANTS* section of this report).

To date as part of this project, DEM inspected 155 dams; 35 of which (numbers 616 through 650) were not previously included in the DEM inventory. A list of the dams and their conditions follows:

City/Town	Dam No.	Dam Name	Embankment	Spillway	Low Level Outlet
Burrillville	1	Wallum	Good	Fair	Good
Burrillville	4	Pendergast Mill	Fair	Poor	Good

Requested Inspections

State law requires DEM to inspect any dam upon a written request by a person owning property that would be subject to harm resulting from failure of the dam, or by a city or town official concerned with loss of life or damage to a highway or bridge resulting from the failure. The following seven dams were inspected based on such requests or requests from some other concerned person:

City/Town	Dam No.	Dam Name	Hazard	Embankment	Spillway	Low Level Outlet
Coventry	177	Tiogoue	Low	Fair	Fair	Good
Exeter	219	Boone	Low	Poor	Fair	Good
Exeter	240	Yorker Mill	Low	Fair to Poor	Good	Poor
Lincoln/ Cumberland	59	Manville	Significant	Not Applicable	Fair	Poor
North Providence	133	Allendale	Low	Fair	Good	Good
North Smithfield	48	Forestdale	Significant	Not Applicable	Fair	Poor
Pawtucket	294	Ten Mile Reservation	Low	Not Applicable	Fair	Poor

Not applicable      feature not present at this dam

Dam number 177 (Tiogoue) in Coventry has been an ongoing concern to DEM since 1999. Following Hurricane Floyd, a neighborhood association’s call about the safety of the dam prompted a DEM inspection to determine if the dam, which is owned or operated by three separate parties, was safe. In July 2000, DEM determined that the condition of the spillway was inadequate and the dam was unsafe. DEM then issued an informal enforcement action against the two owners requiring the spillway be returned to its original condition.

The investigation continued through 2001. An engineer retained by one of the owners stated that in order for the spillway to be returned to its original condition, the area downstream of the spillway would have to be modified to safely accommodate the flow.

In 2002, due to lack of progress, DEM and the Attorney General’s Office filed a complaint in Superior Court asking the court to order the owners to repair the spillway. Without proceeding to a court hearing, the parties attempted to negotiate a resolution, but these negotiations were unsuccessful.

In 2003, the Town of Coventry purchased the property downstream of the spillway and restored the spillway to the original condition. The channel downstream of the spillway must be restored to the original condition to fully resolve this matter.

Dam number 219 (Boone) in Exeter was inspected following an observation made by one of the owners of a sediment laden flow of water through the downstream stone face of the earthen dam, in the area of the low level outlet. The owner quickly contacted an engineering consultant who recommended an immediate lowering of the impoundment until the flow ceased, in order to mitigate safety concerns. The engineering consultant later discovered large voids in the embankment and the impoundment was lowered further. Repair plans were submitted to DEM, with work expected to commence in 2004.

Dam number 240 (Yorker Mill) in Exeter was originally inspected in 2000, following a request by one of the owners, whose business is located in a former mill building located immediately downstream of a section of embankment. The owner noted an increase in seepage through the earthen embankment and retained an engineer who recommended that the impoundment be immediately lowered. In 2001, the owners installed siphons to lower the impoundment and reconstructed the concrete crest of the spillway. In 2002, the spillway was inspected and the seepage was not present. In 2003, the owner repaired the upstream face of the embankment by adding fill and stone erosion protection. In addition, the owner of another section of embankment planned to cut vegetation and fill erosion, and an on site meeting/inspection was performed to review the proposed work.

Dam number 59 (Manville) in Lincoln/Cumberland was inspected following a concern with bubbling observed from the base of the spillway. This is a run of the river dam at which water has always been observed to be flowing over the spillway. Although the spillway could not be observed in a dry condition, the bubbling appeared to be the natural rolling motion of the water and was not a safety concern.

Dam number 133 (Allendale) in North Providence was inspected based on a complaint of a lower than normal impoundment. The inspection revealed an open low level outlet. The impoundment was lowered for several months to perform work on contaminated sediment at a Superfund Site located in the impoundment.

Dam number 48 (Forestdale) in North Smithfield was inspected following a concern that the top of the spillway was deteriorating. The wooden caplogs were originally about 12 inches high on the crest of the spillway. Lack of maintenance resulted in deterioration and, along different sections of the spillway, the caplogs were either displaced or no longer present. The remainder of the stone faced spillway appeared to be well aligned and did not present a safety concern.

Dam number 294 (Ten Mile Reservation) in Pawtucket was inspected based on a complaint that the dam was failing. Some areas of the concrete dam were badly deteriorated, most notably the training wall downstream of the spillway, which allowed water to be present on the wrong side. However, the portions of the dam which actually created the impoundment, although not well maintained, did not appear to be of immediate concern of failure.

#### High Hazard Dam Inspections

The high hazard dams were last inspected in 2001 and are scheduled to be inspected in 2004.

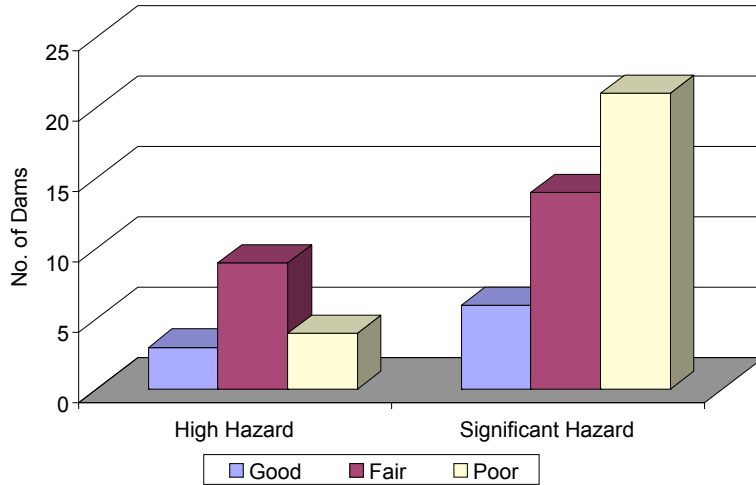

#### Significant Hazard Dam Inspections

The significant hazard dams were last inspected in 1999 and 2000.

#### Conditions Of High And Significant Hazard Dams

A summary chart of the current conditions of the high and significant hazard dams follows. This summary is based on inspections conducted in 1999 through 2001.

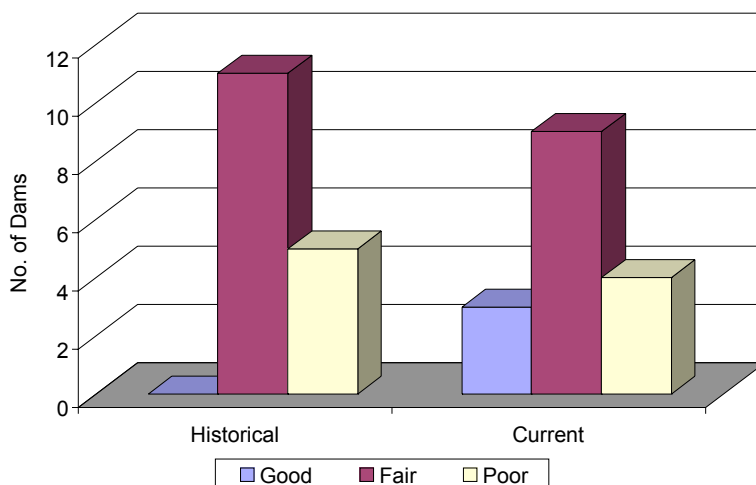

**Conditions of High (2001) and Significant (1999/2000) Hazard Dams**

It is abundantly clear that the majority of the high and significant hazard dams are in need of maintenance and repair to return them to good condition. The 2001 Dam Safety Task Force Final Report clearly addresses this potentially hazardous situation.

DEM has reviewed historical inspection reports for high and significant hazard dams. The majority of the historical data was taken from the last 20 years. These conditions, compared to current conditions, are summarized in the following two charts:

**Conditions of High Hazard Dams**

**Conditions of Significant Hazard Dams**

The charts illustrate general trends of improving conditions of the high hazard dams and deteriorating conditions for the significant hazard dams. Many of these significant hazard dams will likely be reclassified as either low or high hazard dams through DEM's ongoing classification assessment.

**GRANTS**

During 2000 through 2002, DEM received a FEMA National Dam Safety Program 3-year grant totaling \$144,278. During 2002, a contract for \$55,143 was awarded to an engineering consultant to provide hazard classification assessments for 68 dams. A final review of the reports for these assessments has been completed; a final report is being prepared and is expected to be submitted in early 2004. We expect this report will be of significant interest to dam owners and municipalities. In 2003, this contract was increased by \$30,818, to assess an additional 38 dams. Selection of the dams to be assessed is ongoing and is being coordinated with the *Statewide Inventory and Inspection Project* discussed above.

Also in 2003, DEM's Dam Safety Program made the following purchases: a Honda Civic Hybrid (gasoline/electric) automobile, aerial photographs of the state, a handheld global positioning system (GPS) unit, computer hardware, camera accessories, and an office copy machine and printer. All of these items will assist with the inventory and inspection of dams.

In 2003, DEM applied for a 3-year FEMA grant for the 2003 to 2005 period, totaling \$118,965, and received a \$39,655 award for the first year. The money will be used to retain engineering services to perform detailed dam break analyses, including spillway capacity calculations and inundation mapping of sufficient detail to allow development of emergency action plans, for selected high hazard dams.

**DEM OWNED DAM REPAIRS**

DEM continued to move forward under its Capital Development Projects program, undertaking the engineering evaluation, design and reconstruction at the following DEM owned dams:

<b>Dam No.</b>	<b>Dam Name</b>	<b>City/Town</b>	<b>Hazard</b>
108	Stillwater	Smithfield	High

In 1999, DEM retained engineering services to perform an evaluation of dam number 108 (Stillwater). In May 2001, a \$250,000 contract was awarded for the design of repairs to the dam. The design was completed in 2003 and the project will be publicly advertised for bidders in 2004. The engineer's estimated construction cost is \$2.7 million.

**Spillway at Spear Pond Dam (No. 349), Foster**

## **PROGRAM SHORTCOMINGS**

### **STAFFING**

Currently, the Dam Safety Program has a staff of 1.1 full time equivalents, consisting of one full time engineer/inspector and 0.1 administrative/clerical. To successfully meet the requirements of the current statute, DEM estimates one additional full time engineer/inspector is necessary.

### **FINANCIAL ASSISTANCE FOR REPAIRS**

The Governor's Dam Safety and Maintenance Task Force concluded that repairs to bring all Rhode Island dams up to current safety standards could average as much as \$800,000 per dam. Unfortunately, the state is not able to offer any financial assistance for these repairs. In many cases, the costs are so overwhelming that even if the state were to offer a repair loan, the owner could not afford to repay it. Creative financial assistance will be a key element for improving the condition of dams in the state.

### **INSPECTION LIMITATIONS**

By law, DEM is required to cause to be inspected all the dams in the state. However, the visual inspections performed by the Dam Safety Program do not involve full engineering analyses of the structural integrity of dams. DEM does not have the staff nor the financial resources to ensure that such inspections are completed. Although a visual inspection can provide indicators of underlying problems, an engineering analysis is needed to fully assess the condition of the dam.

### **REGULATIONS / TECHNICAL GUIDANCE DOCUMENTS**

DEM has not promulgated dam safety regulations, nor does it have technical guidance documents for distribution to all dam owners. Both of these documents would help the regulated community and consultants understand what is expected of a dam owner. As noted previously, DEM has been developing comprehensive regulations to address recommendations of the Governor's Task Force on Dam Safety and Maintenance.

This completes the activities performed in 2003. For further information on the Dam Safety Program please contact David Chopy at 222-1360.
