INLET SUMMARY SHEET

INLET:  East of Jacks Island (#47)

DATE AND TIME SURVEYED AND TIDE STAGE:  23 March 1999, 16:20-17:00. High at 12:32 (+3.6), Low at 17:48 (-0.1), at Anthony Point, Sakonnet River Station #1147.

INLET CLASS:  B/C

GEOMORPHOLOGY:  A bayhead pocket beach/spit that shelters a coastal pond. Sediment is so sparse that most of the spit complex is overwashed at high tide.

PRINCIPAL RESOURCES AT RISK:  Some salt marshes and tidal flats are associated with the area. Birds, including waterfowl (black ducks, mergansers, scaups, brants, diving ducks, buffleheads), shorebirds, raptors (osprey), and gulls utilize this location. Winter flounder, weakfish, and striped bass are found in the vicinity. Oysters, clams and quahogs (*Mercenaria*) are present. Recreational fishing (including striped bass) and clamming occurs in the vicinity of Sapowet Point. This area is part of the Emily Rueker Wildlife Refuge. There are a few residences on the eastern side of the marsh.

PRELIMINARY PROTECTION STRATEGY:  Due to absence of good collection points and the fact that much of the entrance is overwashed at high tide, the objective is to prevent incoming oil by deploying two lines of protection boom across the entire entrance to the pond. Construction of a sediment dike is not practical due to the large length that would be necessary (approximately 300 yards) and the lack of available sediment.

From an anchor point located at the base of the western-most riprap groin on the western side of the pond, deploy protection boom in a northerly direction on the western side of the riprap. From the end of the riprap, continue with protection boom in a NE direction across the entire length of the pond to an anchor point on the riprap located north of the pond. From an anchor point located at the base of the eastern riprap on the western side of the pond, deploy protection boom in a northerly direction on the western side of the riprap. From the end of the riprap, continue with protection boom in a NE direction across the entire length of the pond to an anchor point on the riprap located north of the pond. A skimmer could be positioned outside the outer line of boom to collect any oil that accumulates there.
