1.0 INTRODUCTION

ATC Group Services LLC (ATC) was retained by AP Enterprise to install four (4) groundwater monitoring wells and a total of eleven (11) landfill gas monitoring points, and to conduct two years of quarterly groundwater and landfill gas monitoring at the former Portsmouth Landfill located on Park Avenue in Portsmouth, Rhode Island (the Site). The objective of this work is to support the Rhode Island Department of Environmental Management (RIDEM) approved Site Monitoring Plan as prepared by Tim O'Connor & Company LLC. This is the fifth quarterly report prepared by ATC.

1.1 Site Location and Description

The entrance to the former Portsmouth Landfill is located 500 feet west-northwest of the intersection formed by Boyds Lane and Park Avenue. The property is identified by the Portsmouth Tax Assessor as Plat 20 Lots 1, 2 & 13 and Plat 25 Lot 2 (the Site). The Site encompasses approximately 15.02 acres. The ground surface is generally level, with downward slopes along the landfill margins. Please refer to **Appendix A** for Figure 1 the Site Locus Map and for Site Plan, Figure 2, which was developed by DiPrete Engineering.

2.0 FIELD ACTIVITIES

The following activities were conducted evaluate the potential presence of contamination in soil gas and groundwater as a result of historic landfill activities.

2.1 Monitoring Well Gauging and Area Groundwater Flow

On April 25, 2017, four soil borings completed as groundwater monitoring wells (MW-1, MW-2, MW-3 and MW-4) were installed at the Site by TDS Technical Drilling Services (TDS) of Sterling, MA. Groundwater monitoring well locations are depicted on the Site Plan, Figure 2.

Groundwater monitoring wells were constructed in each of the four soil borings using two-inch diameter, polyvinyl chloride (PVC) riser and 10 to 15 feet of machine-slotted 0.01 inch well screen. The well screen was placed to intercept the groundwater table.

On June 15, 2017, DiPrete Engineering completed a well elevation survey of the installed monitoring wells. The monitoring wells were surveyed with reference to mean seal level. Based upon the well elevation survey, the depth to groundwater and resulting groundwater gradients indicate the flow is directed radially away from well MW-3. The highest groundwater elevation (2.90 feet above mean sea level) was noted at well MW-3.

On July 31, 2018, ATC gauged the depth to groundwater in the monitoring wells using a Solinst electronic oil/water interface probe. ATC gauged the depth to groundwater from the top of the PVC well risers. The depth to groundwater ranged from 7.90 feet in MW-1 to 15.18 feet in MW-3. Non-aqueous phase liquids were not detected on the water surface, or in the bottom of the wells. Based upon the groundwater elevation data, the groundwater gradient is directed toward the south on the southern portion of the Site, to the north on the northern portion of the Site and to the east on the eastern portion. A Water Level Gauging Sheet is provided in **Appendix B**. A Groundwater Contour Map developed using the Golden Software "Surfer Program" is superimposed on Figure 2.

2.2 Groundwater Sampling and Analysis

On July 31, 2018, ATC completed the fifth quarterly groundwater sampling round. The groundwater samples were obtained using the USEPA's Low Stress Purging and Sampling Procedure (EQA SOP-GW-001). ATC used a variable speed low-flow peristaltic pump to control the rate of purging and limit the drawdown. Disposable polyethylene tubing was used at each well. Field parameters were recorded during sampling using a YSI Pro Series with flow-through cell and LaMotte turbidity meter. Field parameters included pH, water temperature, specific conductance, oxidation reduction potential (ORP) and dissolved oxygen. The groundwater samples were collected upon parameter stabilization, and contained in laboratory grade and pre-preserved sample containers. The samples were chilled in a cooler and transported under Chain of Custody to the ESS Laboratory. ESS analyzed the samples for volatile organic compounds (VOCs) via EPA Method 8260, and metals via EPA Methods 6010 and 7010.

2.3 Groundwater Analytical Results

No metals or VOCs were reported in excess of the RIDEM GA Groundwater Objectives. Detected analytes included barium in MW-1; barium, copper and zinc in MW-2; barium, selenium, 1,4-dichlorobenzene, chlorobenzene, dichlorodifluoromethane and isopropylbenzene in MW-3; and barium, cadmium, copper, nickel, and zinc in MW-4. The groundwater analytical data is summarized in **Appendix C** on Table 1. Refer to **Appendix D** for copies of the laboratory analytical reports.

2.4 Soil Gas Point Installation

At the request of RIDEM, AP Enterprise directed ATC to install additional permanent soil gas points (SGPs) along the property boundary, near monitoring point SG-3. SG-3 is the only SGP to have exceeded methane's lower explosive limit (LEL) of 5% and the RIDEM limit of 25% of the LEL (1.25%). On April 13, 2018 an ATC crew mobilized to the property. Seven (7) peripheral SGPs (SG-5, SG-6, SG-7, SG-8, SG-9, SG-10 and SG-11) were installed linearly every 50 feet along the edge of the Property boundary near SG-3. The seven (7) SGPs were installed in the vadose zone to a depth of 2.5 feet below grade using a slam bar and ¼ inch OD polyethylene tubing terminating with an AMS slotted stainless steel soil gas point. The SGP were secured at grade with a small concrete pad.

TDS installed the original four permanent SGPs (SG-1, SG-2, SG-3 and SG-4) in April of 2017. Each of the original SGPs were installed in the unsaturated zone, using a Geoprobe brand 21" stainless soil gas implant. The depth of placement was determined by the existing depth to groundwater at each location, which ranged from approximately four to ten feet below grade. Each SGP was backfilled with uniform grade, silica sand to approximately one foot above the screen section. Approximately one foot of bentonite was placed above the SGP to seal it from surface water intrusion. Each SGP was connected to 3/8" by 1/4" tubing that was brought to the ground surface. At the ground surface, the SGP tubing was protected by a two-inch, by five-foot lockable standpipe cemented at grade.

The eleven (11) peripheral SGPs are positioned to monitor for potential landfill gas migration away from the solid waste mound. These points are positioned between the landfill mound boundary and the nearby habitable structures. SGP locations are shown on Figure 2.

2.5 Soil Gas Monitoring

On July 31, 2018, ATC conducted the fifth quarterly round of landfill gas monitoring. Soil gas methane, hydrogen sulfide, oxygen and carbon dioxide concentrations were measured at each monitoring point using a Landtech Gem 5000 Landfill Gas Analyzer. Additionally, ambient temperature, barometric pressure, wind speed and wind direction were measured and recorded. SGPs are depicted on Figure 2. The soil gas monitoring results are summarized in **Appendix E** on Table 2.

On July 31, 2018, methane was only in monitoring point SG-3 at a concentration of 7.7%, which is within methane's lower and upper explosive limits of 5% to 15%. The seven other fence-line monitoring points near SG-3 (SG-5 through SG-11) were "non-detect" for methane. Therefore, the measured methane concentrations in the perimeter monitoring points did not exceed the RIDEM Solid Waste Regulation No. 2, Section 2.3.08 (d), of 25% of the LEL (1.25%) at the Site boundary. Hydrogen sulfide was detected at monitoring points SG-3 at 2% and SG-10 at 1%. The carbon dioxide concentrations ranged from non-detectable up to 10.4% at SG-3. The oxygen concentrations ranged from atmospheric (approximately 19.9%) down to 5.2% at SG-3. Table 2 summarizes the monitoring results.

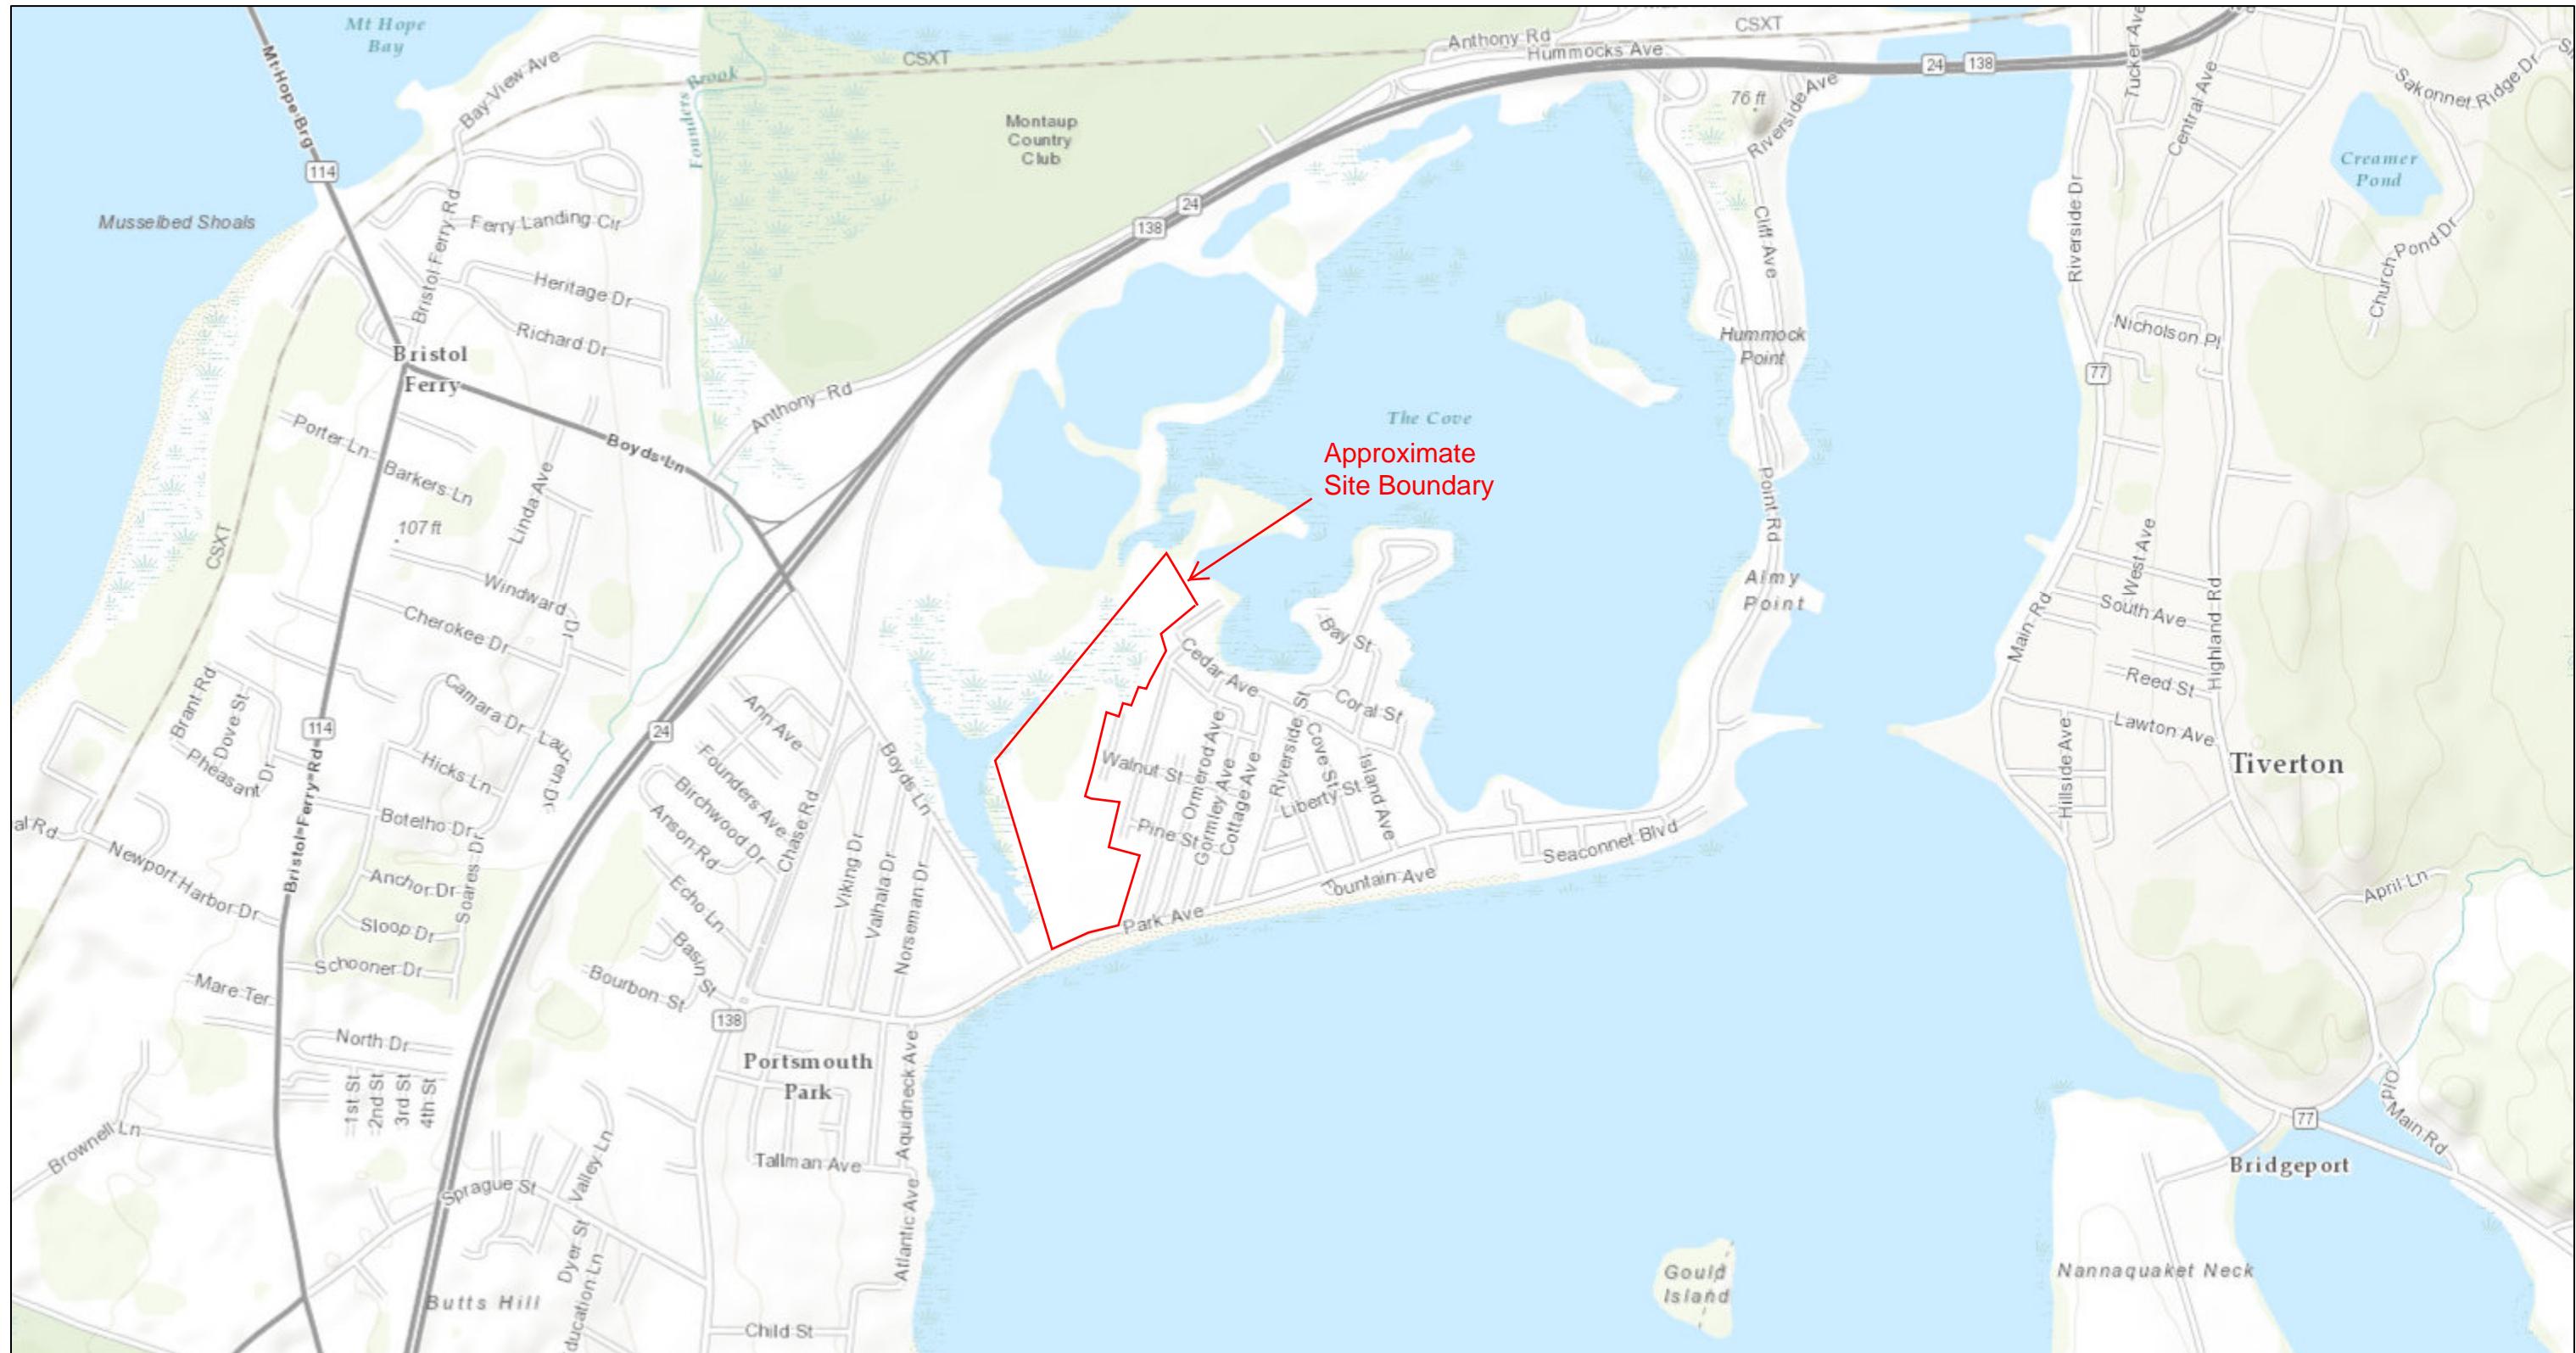

3.0 CONCLUSIONS

ATC has performed the fifth quarterly groundwater and landfill gas monitoring at the former Portsmouth town landfill on Park Avenue in Portsmouth, Rhode Island. Based upon the scope of work and sampling activities completed, ATC concludes the following:

- No metals and no VOCs were reported above applicable GA Groundwater Objectives in the four groundwater samples collected on July 31, 2018.
- The methane concentration measured during this fifth quarterly monitoring event at SG-3 increased since the last quarter, but remained lower than the first quarterly event (May 2017); the other 10 monitoring points were "non-detect" for methane. During this sampling event, the methane concentration at SGP SG-3 was detected at 7.7 which is within methane's lower and upper explosive limits of 5% to 15%. The fence-line methane concentrations did not exceed the RIDEM Solid Waste Regulation No. 2, Section 2.3.08 (d), of 25% of the LEL (1.25%) at the Site boundary.
- The closest building to SG-3 is approximately 200 feet to the east. In ATC's opinion, current conditions do not constitute a threat, however conditions will be closely monitored.
- Hydrogen sulfide was detected at monitoring points SG 3 at 2% and SG-10 at 1%. The carbon dioxide concentrations ranged from non-detectable up to 10.4% at SG-3. The oxygen concentrations ranged from atmospheric (approximately 19.9%) down to 5.2% at SG-3.

RE: Former Portsmouth Landfill (301.238)
ESS Laboratory Work Order Number: 1808001

This signed Certificate of Analysis is our approved release of your analytical results. These results are only representative of sample aliquots received at the laboratory. ESS Laboratory expects its clients to follow all regulatory sampling guidelines. Beginning with this page, the entire report has been paginated. This report should not be copied except in full without the approval of the laboratory. Samples will be disposed of thirty days after the final report has been delivered. If you have any questions or concerns, please feel free to call our Customer Service Department.

Laurel Stoddard
Laboratory Director

REVIEWED

By ESS Laboratory at 4:11 pm, Aug 08, 2018

Analytical Summary

The project as described above has been analyzed in accordance with the ESS Quality Assurance Plan. This plan utilizes the following methodologies: US EPA SW-846, US EPA Methods for Chemical Analysis of Water and Wastes per 40 CFR Part 136, APHA Standard Methods for the Examination of Water and Wastewater, American Society for Testing and Materials (ASTM), and other recognized methodologies. The analyses with these noted observations are in conformance to the Quality Assurance Plan. In chromatographic analysis, manual integration is frequently used instead of automated integration because it produces more accurate results.

The test results present in this report are in compliance with TNI and relative state standards, and/or client Quality Assurance Project Plans (QAPP). The laboratory has reviewed the following: Sample Preservations, Hold Times, Initial Calibrations, Continuing Calibrations, Method Blanks, Blank Spikes, Blank Spike Duplicates, Duplicates, Matrix Spikes, Matrix Spike Duplicates, Surrogates and Internal Standards. Any results which were found to be outside of the recommended ranges stated in our SOPs will be noted in the Project Narrative.

Notes and Definitions

U	Analyte included in the analysis, but not detected
D	Diluted.
ND	Analyte NOT DETECTED at or above the MRL (LOQ), LOD for DoD Reports, MDL for J-Flagged Analytes
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
MDL	Method Detection Limit
MRL	Method Reporting Limit
LOD	Limit of Detection
LOQ	Limit of Quantitation
DL	Detection Limit
I/V	Initial Volume
F/V	Final Volume
§	Subcontracted analysis; see attached report
1	Range result excludes concentrations of surrogates and/or internal standards eluting in that range.
2	Range result excludes concentrations of target analytes eluting in that range.
3	Range result excludes the concentration of the C9-C10 aromatic range.
Avg	Results reported as a mathematical average.
NR	No Recovery
[CALC]	Calculated Analyte
SUB	Subcontracted analysis; see attached report
RL	Reporting Limit
EDL	Estimated Detection Limit
